

NAG Library Function Document

nag_sum_fft_complex_2d (c06puc)

1 Purpose

`nag_sum_fft_complex_2d` (c06puc) computes the two-dimensional discrete Fourier transform of a bivariate sequence of complex data values (using complex data type).

2 Specification

```
#include <nag.h>
#include <nagc06.h>
void nag_sum_fft_complex_2d (Nag_TransformDirection direct, Integer m,
                             Integer n, Complex x[], NagError *fail)
```

3 Description

`nag_sum_fft_complex_2d` (c06puc) computes the two-dimensional discrete Fourier transform of a bivariate sequence of complex data values $z_{j_1 j_2}$, for $j_1 = 0, 1, \dots, m - 1$ and $j_2 = 0, 1, \dots, n - 1$.

The discrete Fourier transform is here defined by

$$\hat{z}_{k_1 k_2} = \frac{1}{\sqrt{mn}} \sum_{j_1=0}^{m-1} \sum_{j_2=0}^{n-1} z_{j_1 j_2} \times \exp\left(\pm 2\pi i \left(\frac{j_1 k_1}{m} + \frac{j_2 k_2}{n}\right)\right),$$

where $k_1 = 0, 1, \dots, m - 1$ and $k_2 = 0, 1, \dots, n - 1$.

(Note the scale factor of $\frac{1}{\sqrt{mn}}$ in this definition.) The minus sign is taken in the argument of the exponential within the summation when the forward transform is required, and the plus sign is taken when the backward transform is required.

A call of `nag_sum_fft_complex_2d` (c06puc) with `direct` = `Nag_ForwardTransform` followed by a call with `direct` = `Nag_BackwardTransform` will restore the original data.

This function performs multiple one-dimensional discrete Fourier transforms by the fast Fourier transform (FFT) algorithm in Brigham (1974) and Temperton (1983).

5 Arguments

1: `direct` – `Nag_TransformDirection` *Input*

On entry: if the forward transform as defined in Section 3 is to be computed, then `direct` must be set equal to `Nag_ForwardTransform`.

If the backward transform is to be computed then `direct` must be set equal to `Nag_BackwardTransform`.

Constraint: `direct` = `Nag_ForwardTransform` or `Nag_BackwardTransform`.

2:	m – Integer	<i>Input</i>
	<i>On entry:</i> m , the first dimension of the transform.	
	<i>Constraint:</i> $m \geq 1$.	
3:	n – Integer	<i>Input</i>
	<i>On entry:</i> n , the second dimension of the transform.	
	<i>Constraint:</i> $n \geq 1$.	
4:	x[m × n] – Complex	<i>Input/Output</i>
	<i>On entry:</i> the complex data values. $x[m \times j_2 + j_1]$ must contain $z_{j_1 j_2}$, for $j_1 = 0, 1, \dots, m - 1$ and $j_2 = 0, 1, \dots, n - 1$.	
	<i>On exit:</i> the corresponding elements of the computed transform.	
5:	fail – NagError *	<i>Input/Output</i>
	The NAG error argument (see Section 3.6 in the Essential Introduction).	

6 Error Indicators and Warnings

NE_ALLOC_FAIL

Dynamic memory allocation failed.

NE_BAD_PARAM

On entry, argument $\langle value \rangle$ had an illegal value.

" $\langle value \rangle$ " is an invalid value of **direct**.

NE_INT

On entry, $m = \langle value \rangle$.

Constraint: $m \geq 1$.

On entry, $n = \langle value \rangle$.

Constraint: $n \geq 1$.

NE_INTERNAL_ERROR

An internal error has occurred in this function. Check the function call and any array sizes. If the call is correct then please contact NAG for assistance.

7 Accuracy

Some indication of accuracy can be obtained by performing a subsequent inverse transform and comparing the results with the original sequence (in exact arithmetic they would be identical).

8 Parallelism and Performance

`nag_sum_fft_complex_2d` (c06puc) is threaded by NAG for parallel execution in multithreaded implementations of the NAG Library.

`nag_sum_fft_complex_2d` (c06puc) makes calls to BLAS and/or LAPACK routines, which may be threaded within the vendor library used by this implementation. Consult the documentation for the vendor library for further information.

Please consult the Users' Note for your implementation for any additional implementation-specific information.

9 Further Comments

The time taken is approximately proportional to $mn \times \log(mn)$, but also depends on the factorization of the individual dimensions m and n . `nag_sum_fft_complex_2d` (c06puc) is faster if the only prime factors are 2, 3 or 5; and fastest of all if they are powers of 2. This function internally allocates a workspace of $mn + n + m + 30$ Complex values.

10 Example

This example reads in a bivariate sequence of complex data values and prints the two-dimensional Fourier transform. It then performs an inverse transform and prints the sequence so obtained, which may be compared to the original data values.
