# NAG Library Function Document nag ode byp fd nonlin gen (d02rac)

# 1 Purpose

nag\_ode\_bvp\_fd\_nonlin\_gen (d02rac) solves a two-point boundary value problem with general boundary conditions for a system of ordinary differential equations, using a deferred correction technique and Newton iteration.

# 2 Specification

```
#include <nag.h>
#include <nagd02.h>
void nag_ode_bvp_fd_nonlin_gen (Integer neq, double *deleps,
           (*fcn)(Integer neq, double x, double eps, const double y[],
           double f[], Nag_User *comm),
     Integer numbeg, Integer nummix,
          (*g)(Integer neq, double eps, const double ya[],
           const double yb[], double bc[], Nag_User *comm),
     Nag_MeshSet init, Integer mnp, Integer *np, double x[], double y[],
     double tol, double abt[],
           (*jacobf)(Integer neq, double x, double eps, const double y[],
           double f[], Nag_User *comm),
           (*jacobg)(Integer neq, double eps, const double ya[],
     void
           const double yb[], double aj[], double bj[], Nag_User *comm),
           (*jaceps)(Integer neq, double x, double eps, const double y[],
     void
           double f[], Nag_User *comm),
           (*jacgep)(Integer neq, double eps, const double ya[],
           const double yb[], double bcep[], Nag_User *comm),
     Nag User *comm, NagError *fail)
```

# 3 Description

nag\_ode\_bvp\_fd\_nonlin\_gen (d02rac) solves a two-point boundary value problem for a system of n ordinary differential equations in the interval [a,b] with b>a. The system is written in the form

$$y'_i = f_i(x, y_1, y_2, \dots, y_n), \quad i = 1, 2, \dots, n$$
 (1)

and the derivatives  $f_i$  are evaluated by **fcn**. With the differential equations (1) must be given a system of n (nonlinear) boundary conditions

$$g_i(y(a), y(b)) = 0, \quad i = 1, 2, \dots, n,$$

where

$$y(x) = [y_1(x), y_2(x), \dots, y_n(x)]^{\mathsf{T}}.$$
 (2)

The functions  $g_i$  are evaluated by **g**. The solution is computed using a finite difference technique with deferred correction allied to a Newton iteration to solve the finite difference equations. The technique used is described fully in Pereyra (1979).

You must supply an absolute error tolerance and may also supply an initial mesh for the finite difference equations and an initial approximate solution (alternatively a default mesh and approximation are used). The approximate solution is corrected using Newton iteration and deferred correction. Then, additional points are added to the mesh and the solution is recomputed with the aim of making the error

everywhere less than your tolerance and of approximately equidistributing the error on the final mesh. The solution is returned on this final mesh.

If the solution is required at a few specific points then these should be included in the initial mesh. If, on the other hand, the solution is required at several specific points then you should use the interpolation functions provided in Chapter e01 if these points do not themselves form a convenient mesh.

The Newton iteration requires Jacobian matrices

$$\left(\frac{\partial f_i}{\partial y_j}\right), \left(\frac{\partial g_i}{\partial y_j(a)}\right) \quad \text{and} \quad \left(\frac{\partial g_i}{\partial y_j(b)}\right).$$

These may be supplied through **jacobf** for  $\left(\frac{\partial f_i}{\partial y_j}\right)$  and **jacobg** for the others. Alternatively the Jacobians may be calculated by numerical differentiation using the algorithm described in Curtis *et al.* (1974).

For problems of the type (1) and (2) for which it is difficult to determine an initial approximation from which the Newton iteration will converge, a continuation facility is provided. You must set up a family of problems

$$y' = f(x, y, \epsilon), \quad g(y(a), y(b), \epsilon) = 0,$$
(3)

where  $f = [f_1, f_2, \dots, f_n]^T$  etc., and where  $\epsilon$  is a continuation parameter. The choice  $\epsilon = 0$  must give a problem (3) which is easy to solve and  $\epsilon = 1$  must define the problem whose solution is actually required. The function solves a sequence of problems with  $\epsilon$  values

$$0 = \epsilon_1 < \epsilon_2 < \dots < \epsilon_p = 1. \tag{4}$$

The number p and the values  $\epsilon_i$  are chosen by the function so that each problem can be solved using the solution of its predecessor as a starting approximation. Jacobians  $\frac{\partial f}{\partial \epsilon}$  and  $\frac{\partial g}{\partial \epsilon}$  are required and they may be supplied by you via **jaceps** and **jacep** respectively or may be computed by numerical differentiation.

# 5 Arguments

1: **neq** – Integer Input

On entry: n, the number of differential equations.

Constraint: neq > 0.

2: deleps – double \* Input/Output

On entry: must be given a value which specifies whether continuation is required. If  $\mathbf{deleps} \leq 0.0$  or  $\mathbf{deleps} \geq 1.0$  then it is assumed that continuation is not required. If  $0.0 < \mathbf{deleps} < 1.0$  then it is assumed that continuation is required unless  $\mathbf{deleps} < \sqrt{machine\ precision}$  when an error exit is taken.  $\mathbf{deleps}$  is used as the increment  $\epsilon_2 - \epsilon_1$  (see (4)) and the choice  $\mathbf{deleps} = 0.1$  is recommended.

On exit: an overestimate of the increment  $\epsilon_p - \epsilon_{p-1}$  (in fact the value of the increment which would have been tried if the restriction  $\epsilon_p = 1$  had not been imposed). If continuation was not requested then **deleps** = 0.0.

d02rac.2 Mark 24

d02rac

If continuation is not requested then **jaceps** and **jacep** may each be replaced by the NAG defined null function pointer NULLFN.

3: **fcn** – function, supplied by the user

External Function

**fcn** must evaluate the functions  $f_i$  (i.e., the derivatives  $y'_i$ ) at a general point x for a given value of  $\epsilon$ , the continuation parameter (see Section 3).

The specification of **fcn** is:

1: **neq** – Integer

Input

On entry: n, the number of equations.

2:  $\mathbf{x}$  – double

Input

On entry: x, the value of the independent variable.

3: **eps** – double

Input

On entry:  $\epsilon$ , the value of the continuation parameter. This is 1 if continuation is not being used.

4: y[neq] – const double

Input

On entry:  $y_i$ , for i = 1, 2, ..., n, the values of the dependent variables at x.

5:  $\mathbf{f}[\mathbf{neq}] - \mathbf{double}$ 

Output

On exit: the values of the derivatives  $f_i$  evaluated at x given  $\epsilon$ , for  $i = 1, 2, \dots, n$ .

6: **comm** – Nag User \*

Pointer to structure of type Nag\_User.

**p** – Pointer

The type Pointer will be void \*. Before calling nag\_ode\_bvp\_fd\_nonlin\_gen (d02rac) these pointers may be allocated memory and initialized with various quantities for use by **comm** when called from nag\_ode\_bvp\_fd\_nonlin\_gen (d02rac).

4: **numbeg** – Integer

Input

On entry: the number of left-hand boundary conditions (that is the number involving y(a) only). Constraint:  $0 \le \text{numbeg} < \text{neq}$ .

5: **nummix** – Integer

Input

On entry: the number of coupled boundary conditions (that is the number involving both y(a) and y(b)).

Constraint:  $0 \le \text{nummix} \le \text{neq} - \text{numbeg}$ .

6:  $\mathbf{g}$  – function, supplied by the user

External Function

g must evaluate the boundary conditions in equation (3) and place them in the array bc.

The specification of g is:

void g (Integer neq, double eps, const double ya[],
 const double yb[], double bc[], Nag\_User \*comm)

1: **neq** – Integer

Input

On entry: n, the number of equations.

2: **eps** – double

Input

On entry:  $\epsilon$ , the value of the continuation parameter. This is 1 if continuation is not being used.

3: ya[neq] - const double

Input

On entry: the value  $y_i(a)$ , for i = 1, 2, ..., n.

4: yb[neq] - const double

Input

On entry: the value  $y_i(b)$ , for i = 1, 2, ..., n.

5: **bc**[**neq**] – double

Output

On exit: the values  $g_i(y(a), y(b), \epsilon)$ , for i = 1, 2, ..., n. These must be ordered as follows:

- (i) first, the conditions involving only y(a) (see **numbeg**);
- (ii) next, the **nummix** coupled conditions involving both y(a) and y(b) (see **nummix**); and,
- (iii) finally, the conditions involving only y(b) (neq numbeg nummix).
- 6: **comm** Nag User \*

Pointer to structure of type Nag\_User.

**p** – Pointer

The type Pointer will be void \*. Before calling nag\_ode\_bvp\_fd\_nonlin\_gen (d02rac) these pointers may be allocated memory and initialized with various quantities for use by **comm** when called from nag\_ode\_bvp\_fd\_nonlin\_gen (d02rac).

7: init – Nag\_MeshSet

Input

On entry: indicates whether you wish to supply an initial mesh and approximate solution (init = Nag\_UserInitMesh) or whether default values are to be used, (init = Nag\_DefInitMesh).

Constraint: init = Nag\_DefInitMesh or Nag\_UserInitMesh.

8: **mnp** – Integer

Input

On entry: **mnp** must be set to the maximum permitted number of points in the finite difference mesh.

Constraint:  $mnp \ge 32$ .

9: **np** – Integer \*

Input/Output

On entry: must be set to the number of points to be used in the initial mesh.

Constraint:  $4 \le np \le mnp$ .

On exit: the number of points in the final mesh.

d02rac.4 Mark 24

10: 
$$x[mnp]$$
 – double

Input/Output

On entry: you must set  $\mathbf{x}[0] = a$  and  $\mathbf{x}[\mathbf{np} - 1] = b$ . If  $\mathbf{init} = \text{Nag\_DefInitMesh}$  on entry a default equispaced mesh will be used, otherwise you must specify a mesh by setting  $\mathbf{x}[i-1] = x_i$ , for  $i = 2, 3, ..., \mathbf{np} - 1$ .

Constraints:

if init = Nag\_DefInitMesh, 
$$\mathbf{x}[0] < \mathbf{x}[\mathbf{np} - 1]$$
; if init = Nag\_UserInitMesh,  $\mathbf{x}[0] < \mathbf{x}[1] < \cdots < \mathbf{x}[\mathbf{np} - 1]$ .

On exit:  $\mathbf{x}[0], \mathbf{x}[1], \dots, \mathbf{x}[\mathbf{np} - 1]$  define the final mesh (with the returned value of  $\mathbf{np}$ ) and  $\mathbf{x}[0] = a$  and  $\mathbf{x}[\mathbf{np} - 1] = b$ .

11: 
$$\mathbf{v}[\mathbf{neq} \times \mathbf{mnp}] - \text{double}$$

Input/Output

On entry: if init = Nag\_DefInitMesh, then y need not be set.

If **init** = Nag\_UserInitMesh, then the array  $\mathbf{y}$  must contain an initial approximation to the solution such that  $\mathbf{y}[(j-1) \times \mathbf{mnp} + i - 1]$  contains an approximation to

$$y_i(x_i), i = 1, 2, ..., np$$
 and  $j = 1, 2, ..., n$ .

On exit: the approximate solution  $z_i(x_i)$  satisfying (5) on the final mesh, that is

$$\mathbf{y}[(j-1) \times \mathbf{mnp} + i - 1] = z_i(x_i), \quad i = 1, 2, ..., \mathbf{np} \text{ and } j = 1, 2, ..., n,$$

where  $\mathbf{np}$  is the number of points in the final mesh. If an error has occurred then  $\mathbf{y}$  contains the latest approximation to the solution. The remaining columns of  $\mathbf{y}$  are not used.

12: **tol** – double *Input* 

On entry: a positive absolute error tolerance. If

$$a = x_1 < x_2 < \cdots < x_{np} = b$$

is the final mesh,  $z_j(x_i)$  is the *j*th component of the approximate solution at  $x_i$ , and  $y_j(x)$  is the *j*th component of the true solution of (1) and (2), then, except in extreme circumstances, it is expected that

$$|z_j(x_i) - y_j(x_i)| \le \text{tol}, \quad i = 1, 2, \dots, \text{np} \text{ and } j = 1, 2, \dots, n.$$
 (5)

Constraint: tol > 0.0.

13: **abt**[**neq**] – double

Output

On exit: abt[i-1], for  $i=1,2,\ldots,n$ , holds the largest estimated error (in magnitude) of the *i*th component of the solution over all mesh points.

14: **jacobf** – function, supplied by the user

External Function

**jacobf** evaluates the Jacobian 
$$\left(\frac{\partial f_i}{\partial y_j}\right)$$
, for  $i=1,2,\ldots,n$  and  $j=1,2,\ldots,n$ , given  $x$  and  $y_j$ , for  $j=1,2,\ldots,n$ .

If all Jacobians are to be approximated internally by numerical differentiation then it must be replaced by the NAG defined null function pointer NULLFN.

The specification of **jacobf** is:

1: **neq** – Integer

Input

On entry: n, the number of equations.

2:  $\mathbf{x}$  – double Input

On entry: x, the value of the independent variable.

3: **eps** – double *Input* 

On entry:  $\epsilon$ , the value of the continuation parameter. This is 1 if continuation is not being used.

4:  $\mathbf{y}[\mathbf{neq}] - \mathbf{const}$  double Input

On entry:  $y_i$ , for i = 1, 2, ..., n, the values of the dependent variables at x.

5:  $\mathbf{f}[\mathbf{neq} \times \mathbf{neq}] - \mathbf{double}$  Output

On exit:  $\mathbf{f}[(j-1) \times \mathbf{neq} + i - 1]$  must be set to the value of  $\frac{\partial f_i}{\partial y_j}$ , evaluated at the point (x,y), for  $i=1,2,\ldots,n$  and  $j=1,2,\ldots,n$ .

6: **comm** – Nag User \*

Pointer to structure of type Nag User.

p - Pointer

The type Pointer will be void \*. Before calling nag\_ode\_bvp\_fd\_nonlin\_gen (d02rac) these pointers may be allocated memory and initialized with various quantities for use by **comm** when called from nag\_ode\_bvp\_fd\_nonlin\_gen (d02rac).

Note that if **jacobf** is supplied then **jacobg** must also be supplied. Note that if **jacobf** is supplied and continuation is requested then **jaceps** and **jacgep** must also be supplied.

15: **jacobg** – function, supplied by the user

External Function

**jacobg** evaluates the Jacobians  $\left(\frac{\partial g_i}{\partial y_j(a)}\right)$  and  $\left(\frac{\partial g_i}{\partial y_j(b)}\right)$ . The ordering of the rows of **aj** and **bj** must correspond to the ordering of the boundary conditions described in the specification of **g**. If all Jacobians are to be approximated internally by numerical differentiation then it must be replaced by the NAG defined null function pointer NULLFN.

```
The specification of jacobg is:
```

1: **neq** – Integer Input

On entry: n, the number of equations.

2: **eps** – double *Input* 

On entry:  $\epsilon$ , the value of the continuation parameter. This is 1 if continuation is not being used.

- 3: ya[neq] const double Input On entry: the value  $y_i(a)$ , for i = 1, 2, ..., n.
- 4:  $\mathbf{yb}[\mathbf{neq}]$  const double Input

  On entry: the value  $y_i(b)$ , for i = 1, 2, ..., n.

d02rac.6 Mark 24

5: 
$$aj[neq \times neq] - double$$

Output

On exit:  $\mathbf{aj}[(i-1) \times \mathbf{neq} + j - 1]$  must be set to the value  $\frac{\partial g_i}{\partial y_j(a)}$ , for  $i = 1, 2, \dots, n$  and  $j = 1, 2, \dots, n$ .

6:  $\mathbf{bj}[\mathbf{neq} \times \mathbf{neq}] - \mathbf{double}$ 

Output

On exit: **bj** $[(i-1) \times \mathbf{neq} + j - 1]$  must be set to the value  $\frac{\partial g_i}{\partial y_j(b)}$ , for i = 1, 2, ..., n and j = 1, 2, ..., n.

7: **comm** – Nag User \*

Pointer to structure of type Nag User.

**p** – Pointer

The type Pointer will be <code>void \*</code>. Before calling <code>nag\_ode\_bvp\_fd\_nonlin\_gen (d02rac)</code> these pointers may be allocated memory and initialized with various quantities for use by **comm** when called from <code>nag\_ode\_bvp\_fd\_nonlin\_gen (d02rac)</code>.

Note that if jacobg is supplied then jacobf must also be supplied.

16: **jaceps** – function, supplied by the user

External Function

**jaceps** evaluates the derivative  $\frac{\partial f_i}{\partial \epsilon}$  given x and y if continuation is being used.

If all Jacobians (derivatives) are to be approximated internally by numerical differentiation, or continuation is not being used, then it must be replaced by the NAG defined null function pointer NULLFN.

The specification of jaceps is:

1: **neq** – Integer

Input

On entry: n, the number of equations.

2:  $\mathbf{x}$  – double

Input

On entry: x, the value of the independent variable.

3: **eps** – double

Input

On entry:  $\epsilon$ , the value of the continuation parameter.

4:  $\mathbf{y}[\mathbf{neq}] - \mathbf{const} \ \mathbf{double}$ 

Input

On entry: the solution values  $y_i$ , for i = 1, 2, ..., n, at the point x.

5:  $\mathbf{f}[\mathbf{neq}] - \mathbf{double}$ 

Output

On exit:  $\mathbf{f}[i-1]$  must contain the value  $\frac{\partial f_i}{\partial \epsilon}$  at the point (x,y), for  $i=1,2,\ldots,n$ .

6: **comm** – Nag User \*

Pointer to structure of type Nag\_User.

#### **p** – Pointer

The type Pointer will be void \*. Before calling nag\_ode\_bvp\_fd\_nonlin\_gen (d02rac) these pointers may be allocated memory and initialized with various quantities for use by **comm** when called from nag\_ode\_bvp\_fd\_nonlin\_gen (d02rac).

Note that if jaceps is defined then jacgep must also be defined.

17: **jacgep** – function, supplied by the user

External Function

**jacgep** evaluates the derivatives  $\frac{\partial g_i}{\partial \epsilon}$  if continuation is being used.

If all Jacobians (derivatives) are to be approximated internally by numerical differentiation, or continuation is not being used, then it must be replaced by the NAG defined null function pointer NULLFN.

The specification of jacgep is:

void jacgep (Integer neq, double eps, const double ya[],
 const double yb[], double bcep[], Nag\_User \*comm)

1: **neq** – Integer *Input* 

On entry: n, the number of equations.

2: **eps** – double *Input* 

On entry:  $\epsilon$ , the value of the continuation parameter.

3: ya[neq] – const double Input

On entry: the value of  $y_i(a)$ , for i = 1, 2, ..., n.

4: **yb[neq**] – const double *Input* 

On entry: the value of  $y_i(b)$ , for i = 1, 2, ..., n.

5: **bcep[neq]** – double Output

On exit:  $\mathbf{bcep}[i-1]$  must contain the value of  $\frac{\partial g_i}{\partial \epsilon}$ , for  $i=1,2,\ldots,n$ .

6: **comm** – Nag User \*

Pointer to structure of type Nag\_User.

**p** – Pointer

The type Pointer will be <code>void \*</code>. Before calling <code>nag\_ode\_bvp\_fd\_nonlin\_gen (d02rac)</code> these pointers may be allocated memory and initialized with various quantities for use by **comm** when called from <code>nag\_ode\_bvp\_fd\_nonlin\_gen (d02rac)</code>.

Note that if jacgep is defined then jaceps must also be defined.

18: **comm** – Nag User \*

Pointer to structure of type Nag\_User.

d02rac.8 Mark 24

#### **p** – Pointer

The type Pointer will be void \*. Before calling nag\_ode\_bvp\_fd\_nonlin\_gen (d02rac) these pointers may be allocated memory and initialized with various quantities for use by **comm** when called from nag ode bvp fd nonlin gen (d02rac).

#### 19: **fail** – NagError \*

Input/Output

The NAG error argument (see Section 3.6 in the Essential Introduction).

## 6 Error Indicators and Warnings

#### NE 2 INT ARG ZERO

On entry, numbeg = 0 and nummix = 0. These arguments must not both be zero.

## NE\_2\_REAL\_ARG\_LE

```
On entry, \mathbf{x}[0] = \langle value \rangle and \mathbf{x}[\mathbf{np} - 1] = \langle value \rangle.
Constraint: \mathbf{x}[0] < \mathbf{x}[\mathbf{np} - 1].
```

### **NE ALLOC FAIL**

Dynamic memory allocation failed.

#### **NE BAD PARAM**

On entry, argument init had an illegal value.

#### **NE CONV CONT**

Convergence failure. There are a number of possible causes.

- (a) Faulty coding of the Jacobian calculation functions.
- (b) If Jacobians have not been supplied then inaccurate Jacobians have been calculated internally (not very likely).
- (c) A poor choice of initial mesh or initial starting conditions either by the user or by default. Try using the continuation facility.

The Newton iteration has failed to converge.

This could be due to there being too few points in the initial mesh or to the initial approximate solution being too inaccurate.

If this latter reason is suspected or you cannot make changes to prevent this error, you should use the function with a continuation facility instead.

#### NE CONV CONT DELEPS

**deleps** is required to be less than *machine precision* for continuation to proceed. It is likely that either the problem has no solution for some value near the current value of  $\epsilon$  or that the problem is so difficult that even with continuation it is unlikely to be solved using this function. Using more mesh points may help.

The continuation step is required to be less than *machine precision* for continuation to proceed. It is likely that either the problem has no solution for some value of the continuation parameter near the current value or that the problem is so difficult that even with continuation it is unlikely to be solved using this function. In the latter case using more mesh points initially may help.

#### NE CONV CONT DEP

There is no dependence on the continuation parameter when continuation is being used. This can be due to faulty coding of derivatives with respect to the continuation parameter or to a zero initial choice of approximate solution.

There is no dependence on  $\epsilon$  when continuation is being used. This may be due to faulty coding of **jaceps** or **jacep**, or in some circumstances, to a zero initial choice of approximate solution (such as is chosen when **init** = Nag\_DefInitMesh).

### **NE CONV JACOBG**

The Jacobian calculated by **jacobg** (or the equivalent matrix calculated by numerical differentiation) is singular. This may be due to faulty coding of **jacobg** or in some circumstances, to a zero initial choice of approximate solution (such as is chosen when **init** = Nag\_DefInitMesh).

The Jacobian for the boundary conditions is singular.

This may occur due to faulty coding of the Jacobian or, in some circumstances, to a zero initial choice of approximate solution.

## NE\_CONV\_MESH

A finer mesh is required for the accuracy requested; that is,  $mnp = \langle value \rangle$  is not large enough.

### **NE CONV ROUNDOFF**

Newton iteration has reached round-off level.

If desired accuracy has not been reached, then **tol** is too small for this problem and this *machine precision*.

Solution cannot be improved due to roundoff error. Too much accuracy might have been requested.

#### NE INT ARG LT

```
On entry, \mathbf{mnp} = \langle value \rangle.
Constraint: \mathbf{mnp} \geq 32.
On entry, \mathbf{neq} = \langle value \rangle.
Constraint: \mathbf{neq} \geq 1.
On entry, \mathbf{np} = \langle value \rangle.
Constraint: \mathbf{np} \geq 4.
On entry, \mathbf{numbeg} = \langle value \rangle.
Constraint: \mathbf{numbeg} \geq 0.
On entry, \mathbf{nummix} = \langle value \rangle.
Constraint: \mathbf{nummix} \geq 0.
```

# **NE INT RANGE CONS**

```
On entry, \mathbf{np} = \langle value \rangle and \mathbf{mnp} = \langle value \rangle.
Constraint: \mathbf{np} \leq \mathbf{mnp}.
On entry, \mathbf{numbeg} = \langle value \rangle and \mathbf{neq} = \langle value \rangle.
Constraint: \mathbf{numbeg} = \langle value \rangle, \mathbf{nummix} = \langle value \rangle and \mathbf{neq} = \langle value \rangle.
Constraint: \mathbf{numbeg} + \mathbf{nummix} \leq \mathbf{neq}.
```

#### **NE INTERNAL ERROR**

A continuation error occurred, but continuation is not being used.

Please contact NAG.

An internal error has occurred in this function. Check the function call and any array sizes. If the call is correct then please contact NAG for assistance.

A serious error occurred in a call to the internal integrator.

The error code internally was \( \nabla value \rangle \).

Please contact NAG.

d02rac.10 Mark 24

## NE INVALID FUN JAC

Only one of **jacobf** or **jacobg** has been set to non-null possibly implying user-defined Jacobians. Both must be non-null.

### NE INVALID FUN JAC CONT

**deleps** has been set to  $\langle value \rangle$  implying continuation and both **jacobf** and **jacobg** have been set to non-null implying user-defined Jacobians. Hence the functions **jaceps** and **jacgep** must also be non-null.

# NE\_INVALID\_FUN\_JAC\_NO\_CONT

**deleps** has been set to  $\langle value \rangle$  implying no continuation and both **jacobf** and **jacobg** have been set to non-null implying user-defined Jacobians. Hence the functions **jaceps** and **jacgep** must be **NULL**.

## NE\_INVALID\_FUN\_NO\_JAC\_CONT

**deleps** has been set to  $\langle value \rangle$  implying continuation and both **jacobf** and **jacobg** have been set to **NULL** implying no user-defined Jacobians. Hence the functions **jaceps** and **jacgep** must also be **NULL**.

### NE NOT STRICTLY INCREASING

On entry the mesh points are not in strictly ascending order. For  $i = \langle value \rangle$ , mesh point  $i = \langle value \rangle$ , but mesh point  $i + 1 = \langle value \rangle$ .

## NE REAL ARG LE

On entry, **tol** =  $\langle value \rangle$ . Constraint: **tol** > 0.0.

# 7 Accuracy

The solution returned by the function will be accurate to your tolerance as defined by the relation (5) except in extreme circumstances. The final error estimate over the whole mesh for each component is given in the array **abt**. If too many points are specified in the initial mesh, the solution may be more accurate than requested and the error may not be approximately equidistributed.

## 8 Parallelism and Performance

Not applicable.

## 9 Further Comments

There are too many factors present to quantify the timing. The time taken by nag\_ode\_bvp\_fd\_nonlin\_gen (d02rac) is negligible only on very simple problems.

In the case where you wish to solve a sequence of similar problems, the use of the final mesh and solution from one case as the initial mesh is strongly recommended for the next.

#### 10 Example

This example solves the differential equation

$$y''' = -yy'' - 2\epsilon \left(1 - {y'}^2\right)$$

with  $\epsilon = 1$  and boundary conditions

$$y(0) = y'(0) = 0, \quad y'(10) = 1$$

to an accuracy specified by tol = 1.0e-4. The continuation facility is used with the continuation parameter  $\epsilon$  introduced as in the differential equation above and with deleps = 0.1 initially. (The continuation facility is not needed for this problem and is used here for illustration.)
