

NAG Library Function Document

nag_dgelss (f08kac)

1 Purpose

nag_dgelss (f08kac) computes the minimum norm solution to a real linear least squares problem

$$\min_x \|b - Ax\|_2.$$

2 Specification

```
#include <nag.h>
#include <nagf08.h>
void nag_dgelss (Nag_OrderType order, Integer m, Integer n, Integer nrhs,
                 double a[], Integer pda, double b[], Integer pdb, double s[],
                 double rcond, Integer *rank, NagError *fail)
```

3 Description

nag_dgelss (f08kac) uses the singular value decomposition (SVD) of A , where A is an m by n matrix which may be rank-deficient.

Several right-hand side vectors b and solution vectors x can be handled in a single call; they are stored as the columns of the m by r right-hand side matrix B and the n by r solution matrix X .

The effective rank of A is determined by treating as zero those singular values which are less than **rcond** times the largest singular value.

5 Arguments

1: **order** – Nag_OrderType *Input*

On entry: the **order** argument specifies the two-dimensional storage scheme being used, i.e., row-major ordering or column-major ordering. C language defined storage is specified by **order** = Nag_RowMajor. See Section 3.2.1.3 in the Essential Introduction for a more detailed explanation of the use of this argument.

Constraint: **order** = Nag_RowMajor or Nag_ColMajor.

2: **m** – Integer *Input*

On entry: m , the number of rows of the matrix A .

Constraint: **m** ≥ 0 .

3: **n** – Integer *Input*

On entry: n , the number of columns of the matrix A .

Constraint: **n** ≥ 0 .

4: **nrhs** – Integer *Input*

On entry: r , the number of right-hand sides, i.e., the number of columns of the matrices B and X .

Constraint: $\mathbf{nrhs} \geq 0$.

5: **a[dim]** – double *Input/Output*

Note: the dimension, dim , of the array **a** must be at least

$$\begin{aligned} &\max(1, \mathbf{pda} \times \mathbf{n}) \text{ when } \mathbf{order} = \text{Nag_ColMajor}; \\ &\max(1, \mathbf{m} \times \mathbf{pda}) \text{ when } \mathbf{order} = \text{Nag_RowMajor}. \end{aligned}$$

The (i, j) th element of the matrix A is stored in

$$\begin{aligned} &\mathbf{a}[(j - 1) \times \mathbf{pda} + i - 1] \text{ when } \mathbf{order} = \text{Nag_ColMajor}; \\ &\mathbf{a}[(i - 1) \times \mathbf{pda} + j - 1] \text{ when } \mathbf{order} = \text{Nag_RowMajor}. \end{aligned}$$

On entry: the m by n matrix A .

On exit: the first $\min(m, n)$ rows of A are overwritten with its right singular vectors, stored row-wise.

6: **pda** – Integer *Input*

On entry: the stride separating row or column elements (depending on the value of **order**) in the array **a**.

Constraints:

$$\begin{aligned} &\text{if } \mathbf{order} = \text{Nag_ColMajor}, \mathbf{pda} \geq \max(1, \mathbf{m}); \\ &\text{if } \mathbf{order} = \text{Nag_RowMajor}, \mathbf{pda} \geq \max(1, \mathbf{n}). \end{aligned}$$

7: **b[dim]** – double *Input/Output*

Note: the dimension, dim , of the array **b** must be at least

$$\begin{aligned} &\max(1, \mathbf{pdb} \times \mathbf{nrhs}) \text{ when } \mathbf{order} = \text{Nag_ColMajor}; \\ &\max(1, \max(1, \mathbf{m}, \mathbf{n}) \times \mathbf{pdb}) \text{ when } \mathbf{order} = \text{Nag_RowMajor}. \end{aligned}$$

The (i, j) th element of the matrix B is stored in

$$\begin{aligned} &\mathbf{b}[(j - 1) \times \mathbf{pdb} + i - 1] \text{ when } \mathbf{order} = \text{Nag_ColMajor}; \\ &\mathbf{b}[(i - 1) \times \mathbf{pdb} + j - 1] \text{ when } \mathbf{order} = \text{Nag_RowMajor}. \end{aligned}$$

On entry: the m by r right-hand side matrix B .

On exit: **b** is overwritten by the n by r solution matrix X . If $m \geq n$ and **rank** = n , the residual sum of squares for the solution in the i th column is given by the sum of squares of elements $n + 1, \dots, m$ in that column.

8: **pdb** – Integer *Input*

On entry: the stride separating row or column elements (depending on the value of **order**) in the array **b**.

Constraints:

$$\begin{aligned} &\text{if } \mathbf{order} = \text{Nag_ColMajor}, \mathbf{pdb} \geq \max(1, \mathbf{m}, \mathbf{n}); \\ &\text{if } \mathbf{order} = \text{Nag_RowMajor}, \mathbf{pdb} \geq \max(1, \mathbf{nrhs}). \end{aligned}$$

9: **s[dim]** – double *Output*

Note: the dimension, dim , of the array **s** must be at least $\max(1, \min(\mathbf{m}, \mathbf{n}))$.

On exit: the singular values of A in decreasing order.

10:	rcond – double	<i>Input</i>
<i>On entry:</i> used to determine the effective rank of A . Singular values $s[i - 1] \leq \mathbf{rcond} \times s[0]$ are treated as zero. If $\mathbf{rcond} < 0$, machine precision is used instead.		
11:	rank – Integer *	<i>Output</i>
<i>On exit:</i> the effective rank of A , i.e., the number of singular values which are greater than $\mathbf{rcond} \times s[0]$.		
12:	fail – NagError *	<i>Input/Output</i>

The NAG error argument (see Section 3.6 in the Essential Introduction).

6 Error Indicators and Warnings

NE_ALLOC_FAIL

Dynamic memory allocation failed.

NE_BAD_PARAM

On entry, argument $\langle value \rangle$ had an illegal value.

NE_CONVERGENCE

The algorithm for computing the SVD failed to converge; $\langle value \rangle$ off-diagonal elements of an intermediate bidiagonal form did not converge to zero.

NE_INT

On entry, $\mathbf{m} = \langle value \rangle$.

Constraint: $\mathbf{m} \geq 0$.

On entry, $\mathbf{n} = \langle value \rangle$.

Constraint: $\mathbf{n} \geq 0$.

On entry, $\mathbf{nrhs} = \langle value \rangle$.

Constraint: $\mathbf{nrhs} \geq 0$.

On entry, $\mathbf{pda} = \langle value \rangle$.

Constraint: $\mathbf{pda} > 0$.

On entry, $\mathbf{pdb} = \langle value \rangle$.

Constraint: $\mathbf{pdb} > 0$.

NE_INT_2

On entry, $\mathbf{pda} = \langle value \rangle$ and $\mathbf{m} = \langle value \rangle$.

Constraint: $\mathbf{pda} \geq \max(1, \mathbf{m})$.

On entry, $\mathbf{pda} = \langle value \rangle$ and $\mathbf{n} = \langle value \rangle$.

Constraint: $\mathbf{pda} \geq \max(1, \mathbf{n})$.

On entry, $\mathbf{pdb} = \langle value \rangle$ and $\mathbf{nrhs} = \langle value \rangle$.

Constraint: $\mathbf{pdb} \geq \max(1, \mathbf{nrhs})$.

NE_INT_3

On entry, $\mathbf{pdb} = \langle value \rangle$, $\mathbf{m} = \langle value \rangle$ and $\mathbf{n} = \langle value \rangle$.

Constraint: $\mathbf{pdb} \geq \max(1, \mathbf{m}, \mathbf{n})$.

NE_INTERNAL_ERROR

An internal error has occurred in this function. Check the function call and any array sizes. If the call is correct then please contact NAG for assistance.

7 Accuracy

See Section 4.5 of Anderson *et al.* (1999) for details.

8 Parallelism and Performance

nag_dgelss (f08kac) is threaded by NAG for parallel execution in multithreaded implementations of the NAG Library.

nag_dgelss (f08kac) makes calls to BLAS and/or LAPACK routines, which may be threaded within the vendor library used by this implementation. Consult the documentation for the vendor library for further information.

Please consult the Users' Note for your implementation for any additional implementation-specific information.

9 Further Comments

The complex analogue of this function is nag_zgelss (f08knc).

10 Example

This example solves the linear least squares problem

$$\min_x \|b - Ax\|_2$$

for the solution, x , of minimum norm, where

$$A = \begin{pmatrix} -0.09 & 0.14 & -0.46 & 0.68 & 1.29 \\ -1.56 & 0.20 & 0.29 & 1.09 & 0.51 \\ -1.48 & -0.43 & 0.89 & -0.71 & -0.96 \\ -1.09 & 0.84 & 0.77 & 2.11 & -1.27 \\ 0.08 & 0.55 & -1.13 & 0.14 & 1.74 \\ -1.59 & -0.72 & 1.06 & 1.24 & 0.34 \end{pmatrix} \quad \text{and} \quad b = \begin{pmatrix} 7.4 \\ 4.2 \\ -8.3 \\ 1.8 \\ 8.6 \\ 2.1 \end{pmatrix}.$$

A tolerance of 0.01 is used to determine the effective rank of A .
