

NAG Library Function Document

nag_tsa_spectrum_bivar (g13cdc)

1 Purpose

nag_tsa_spectrum_bivar (g13cdc) calculates the smoothed sample cross spectrum of a bivariate time series using spectral smoothing by the trapezium frequency (Daniell) window.

2 Specification

```
#include <nag.h>
#include <nagg13.h>

void nag_tsa_spectrum_bivar (Integer nxy, NagMeanOrTrend mt_correction,
    double pxy, Integer mw, Integer is, double pw, Integer l, Integer kc,
    const double x[], const double y[], Complex **g, Integer *ng,
    NagError *fail)
```

3 Description

The supplied time series may be mean and trend corrected and tapered as in the description of nag_tsa_spectrum_univar (g13cbc) before calculation of the unsmoothed sample cross-spectrum

$$f_{xy}^*(\omega) = \frac{1}{2\pi n} \left\{ \sum_{t=1}^n y_t \exp(i\omega t) \right\} \times \left\{ \sum_{t=1}^n x_t \exp(-i\omega t) \right\}$$

for frequency values $\omega_j = \frac{2\pi j}{K}$, $0 \leq \omega_j \leq \pi$.

A correction is made for bias due to any tapering.

As in the description of nag_tsa_spectrum_univar (g13cbc) for univariate frequency window smoothing, the smoothed spectrum is returned at a subset of these frequencies,

$$\nu_l = \frac{2\pi l}{L}, l = 0, 1, \dots, [L/2]$$

where [] denotes the integer part.

Its real part or co-spectrum $cf(\nu_l)$, and imaginary part or quadrature spectrum $qf(\nu_l)$ are defined by

$$f_{xy}(\nu_l) = cf(\nu_l) + iqf(\nu_l) = \sum_{|\omega_k| < \pi/M} \tilde{w}_k f_{xy}^*(\nu_l + \omega_k)$$

where the weights \tilde{w}_k are similar to the weights w_k defined for nag_tsa_spectrum_univar (g13cbc), but allow for an implicit alignment shift S between the series:

$$\tilde{w}_k = w_k \exp(-2\pi i S k / L).$$

It is recommended that S is chosen as the lag k at which the cross-covariances $c_{xy}(k)$ peak, so as to minimize bias.

If no smoothing is required, the integer M which determines the frequency window width $\frac{2\pi}{M}$, should be set to n .

The bandwidth of the estimates will normally have been calculated in a previous call of nag_tsa_spectrum_univar (g13cbc) for estimating the univariate spectra of y_t and x_t .

5 Arguments

- 1: **nxy** – Integer *Input*
On entry: the length of the time series x and y , n .
Constraint: **nxy** ≥ 1 .
- 2: **mt_correction** – NagMeanOrTrend *Input*
On entry: whether the data are to be initially mean or trend corrected. **mt_correction** = Nag_NoCorrection for no correction, **mt_correction** = Nag_Mean for mean correction, **mt_correction** = Nag_Trend for trend correction.
Constraint: **mt_correction** = Nag_NoCorrection, Nag_Mean or Nag_Trend.
- 3: **pxy** – double *Input*
On entry: the proportion of the data (totalled over both ends) to be initially tapered by the split cosine bell taper.
 A value of 0.0 implies no tapering.
Constraint: $0.0 \leq \text{pxy} \leq 1.0$.
- 4: **mw** – Integer *Input*
On entry: the frequency width, M , of the smoothing window as $2\pi/M$.
 A value of n implies that no smoothing is to be carried out.
Constraint: $1 \leq \text{mw} \leq \text{nxy}$.
- 5: **is** – Integer *Input*
On entry: the alignment shift, S , between the x and y series. If x leads y , the shift is positive.
Constraint: $-1 < \text{is} < 1$.
- 6: **pw** – double *Input*
On entry: the shape argument, p , of the trapezium frequency window.
 A value of 0.0 gives a triangular window, and a value of 1.0 a rectangular window.
 If **mw** = **nxy** (i.e., no smoothing is carried out) then **pw** is not used.
Constraint: $0.0 \leq \text{pw} \leq 1.0$ if **mw** \neq **nxy**.
- 7: **l** – Integer *Input*
On entry: the frequency division, L , of smoothed cross spectral estimates as $2\pi/L$.
Constraint: **l** ≥ 1 .
l must be a factor of **kc** (see below).
- 8: **kc** – Integer *Input*
On entry: the order of the fast Fourier transform (FFT) used to calculate the spectral estimates. **kc** should be a product of small primes such as 2^m where m is the smallest integer such that $2^m \geq 2n$, provided $m \leq 20$.

Constraints:

$$\mathbf{kc} \geq 2 \times \mathbf{nxy};$$

\mathbf{kc} must be a multiple of \mathbf{l} . The largest prime factor of \mathbf{kc} must not exceed 19, and the total number of prime factors of \mathbf{kc} , counting repetitions, must not exceed 20. These two restrictions are imposed by the internal FFT algorithm used.

- 9: $\mathbf{x}[\mathbf{kc}]$ – const double *Input*
On entry: the \mathbf{nxy} data points of the x series.
- 10: $\mathbf{y}[\mathbf{kc}]$ – const double *Input*
On entry: the \mathbf{nxy} data points of the y series.
- 11: \mathbf{g} – Complex ** *Output*
On exit: the complex vector which contains the \mathbf{ng} cross spectral estimates in elements $\mathbf{g}[0]$ to $\mathbf{g}[\mathbf{ng} - 1]$. The y series leads the x series.
 The memory for this vector is allocated internally. If no memory is allocated to \mathbf{g} (e.g., when an input error is detected) then \mathbf{g} will be **NULL** on return. If repeated calls to this function are required then `NAG_FREE` should be used to free the memory in between calls.
- 12: \mathbf{ng} – Integer * *Output*
On exit: the number of spectral estimates, $[L/2] + 1$, whose separate parts are held in \mathbf{g} .
- 13: **fail** – NagError * *Input/Output*
 The NAG error argument (see Section 3.6 in the Essential Introduction).

6 Error Indicators and Warnings

NE_2_INT_ARG_CONS

On entry, $\mathbf{kc} = \langle \text{value} \rangle$ while $\mathbf{l} = \langle \text{value} \rangle$. These arguments must satisfy $\mathbf{kc} \% \mathbf{l} \neq 0$ when $\mathbf{l} > 0$.

On entry, $\mathbf{kc} = \langle \text{value} \rangle$ while $\mathbf{nxy} = \langle \text{value} \rangle$. These arguments must satisfy $\mathbf{kc} \geq 2 * \mathbf{nxy}$ when $\mathbf{nxy} > 0$.

On entry, $\mathbf{l} = \langle \text{value} \rangle$ while $\mathbf{is} = \langle \text{value} \rangle$. These arguments must satisfy $\|\mathbf{is}\| < \mathbf{l}$ when $\mathbf{l} > 0$.

NE_2_INT_ARG_GT

On entry, $\mathbf{mw} = \langle \text{value} \rangle$ while $\mathbf{nxy} = \langle \text{value} \rangle$. These arguments must satisfy $\mathbf{mw} \leq \mathbf{nxy}$.

NE_ALLOC_FAIL

Dynamic memory allocation failed.

NE_BAD_PARAM

On entry, argument **mt_correction** had an illegal value.

NE_FACTOR_GT

At least one of the prime factors of \mathbf{kc} is greater than 19.

NE_INT_ARG_LT

On entry, $\mathbf{l} = \langle \text{value} \rangle$.

Constraint: $\mathbf{l} \geq 1$.

On entry, **mw** = $\langle value \rangle$.

Constraint: **mw** ≥ 1 .

On entry, **nxy** = $\langle value \rangle$.

Constraint: **nxy** ≥ 1 .

NE_INTERNAL_ERROR

An internal error has occurred in this function. Check the function call and any array sizes. If the call is correct then please contact NAG for assistance.

NE_REAL_ARG_GT

On entry, **pw** must not be greater than 1.0: **pw** = $\langle value \rangle$.

On entry, **pxy** must not be greater than 1.0: **pxy** = $\langle value \rangle$.

NE_REAL_ARG_LT

On entry, **pw** must not be less than 0.0: **pw** = $\langle value \rangle$.

On entry, **pxy** must not be less than 0.0: **pxy** = $\langle value \rangle$.

NE_TOO_MANY_FACTORS

kc has more than 20 prime factors.

7 Accuracy

The FFT is a numerically stable process, and any errors introduced during the computation will normally be insignificant compared with uncertainty in the data.

8 Parallelism and Performance

Not applicable.

9 Further Comments

nag_tsa_spectrum_bivar (g13cdc) carries out an FFT of length **kc** to calculate the sample cross spectrum. The time taken by the function for this is approximately proportional to **kc** \times $\log(\mathbf{kc})$ (but see function document nag_sum_fft_realherm_1d (c06pac) for further details).

10 Example

The example program reads 2 time series of length 296. It selects mean correction and a 10% tapering proportion. It selects a $2\pi/16$ frequency width of smoothing window, a window shape argument of 0.5 and an alignment shift of 3. It then calls nag_tsa_spectrum_bivar (g13cdc) to calculate the smoothed sample cross spectrum and prints the results.
