

NAG Library Function Document

nag_complex_banded_eigensystem_init (f12atc)

1 Purpose

`nag_complex_banded_eigensystem_init` (f12atc) is a setup function for `nag_complex_banded_eigensystem_solve` (f12auc) which may be used for finding some eigenvalues (and optionally the corresponding eigenvectors) of a standard or generalized eigenvalue problem defined by complex, banded, non-Hermitian matrices. The banded matrix must be stored using the LAPACK column ordered storage format for complex banded non-Hermitian matrices (see Section 3.3.4 in the f07 Chapter Introduction).

2 Specification

```
#include <nag.h>
#include <nagf12.h>

void nag_complex_banded_eigensystem_init (Integer n, Integer nev,
    Integer ncv, Integer icomm[], Integer licomm, Complex comm[],
    Integer lcomm, NagError *fail)
```

3 Description

The pair of functions `nag_complex_banded_eigensystem_init` (f12atc) and `nag_complex_banded_eigensystem_solve` (f12auc) together with the option setting function `nag_complex_sparse_eigensystem_option` (f12arc) are designed to calculate some of the eigenvalues, λ , (and optionally the corresponding eigenvectors, x) of a standard eigenvalue problem $Ax = \lambda x$, or of a generalized eigenvalue problem $Ax = \lambda Bx$ of order n , where n is large and the coefficient matrices A and B are banded complex and non-Hermitian.

`nag_complex_banded_eigensystem_init` (f12atc) is a setup function which must be called before the option setting function `nag_complex_sparse_eigensystem_option` (f12arc) and the solver function `nag_complex_banded_eigensystem_solve` (f12auc). Internally, `nag_complex_banded_eigensystem_solve` (f12auc) makes calls to `nag_complex_sparse_eigensystem_iter` (f12apc) and `nag_complex_sparse_eigensystem_sol` (f12aqc); the function documents for `nag_complex_sparse_eigensystem_iter` (f12apc) and `nag_complex_sparse_eigensystem_sol` (f12aqc) should be consulted for details of the algorithm used.

This setup function initializes the communication arrays, sets (to their default values) all options that can be set by you via the option setting function `nag_complex_sparse_eigensystem_option` (f12arc), and checks that the lengths of the communication arrays as passed by you are of sufficient length. For details of the options available and how to set them, see Section 11.1 in `nag_complex_sparse_eigensystem_option` (f12arc).

5 Arguments

- 1: **n** – Integer *Input*
On entry: the order of the matrix *A* (and the order of the matrix *B* for the generalized problem) that defines the eigenvalue problem.
Constraint: $n > 0$.
- 2: **nev** – Integer *Input*
On entry: the number of eigenvalues to be computed.
Constraint: $0 < nev < n - 1$.
- 3: **ncv** – Integer *Input*
On entry: the number of Lanczos basis vectors to use during the computation.
 At present there is no *a priori* analysis to guide the selection of **ncv** relative to **nev**. However, it is recommended that $ncv \geq 2 \times nev + 1$. If many problems of the same type are to be solved, you should experiment with increasing **ncv** while keeping **nev** fixed for a given test problem. This will usually decrease the required number of matrix-vector operations but it also increases the work and storage required to maintain the orthogonal basis vectors. The optimal ‘cross-over’ with respect to CPU time is problem dependent and must be determined empirically.
Constraint: $nev + 1 < ncv \leq n$.
- 4: **icomm**[**max(1, licomm)**] – Integer *Communication Array*
On exit: contains data to be communicated to nag_complex_banded_eigensystem_solve (f12auc).
- 5: **licomm** – Integer *Input*
On entry: the dimension of the array **icomm**.
 If **licomm** = -1, a workspace query is assumed and the function only calculates the required dimensions of **icomm** and **comm**, which it returns in **icomm**[0] and **comm**[0] respectively.
Constraint: $licomm \geq 140$ or **licomm** = -1.
- 6: **comm**[**max(1, licomm)**] – Complex *Communication Array*
On exit: contains data to be communicated to nag_complex_banded_eigensystem_solve (f12auc).
- 7: **lcomm** – Integer *Input*
On entry: the dimension of the array **comm**.
 If **lcomm** = -1, a workspace query is assumed and the function only calculates the dimensions of **icomm** and **comm** required by nag_complex_banded_eigensystem_solve (f12auc), which it returns in **icomm**[0] and **comm**[0] respectively.
Constraint: $lcomm \geq 60$ or **lcomm** = -1.
- 8: **fail** – NagError * *Input/Output*
 The NAG error argument (see Section 3.6 in the Essential Introduction).

6 Error Indicators and Warnings

NE_BAD_PARAM

On entry, argument *<value>* had an illegal value.

NE_INT

On entry, **n** = $\langle value \rangle$.

Constraint: **n** > 0.

On entry, **nev** = $\langle value \rangle$.

Constraint: **nev** > 0.

The length of the complex array **comm** is too small **lcomm** = $\langle value \rangle$, but must be at least $\langle value \rangle$.

The length of the integer array **icomm** is too small **licomm** = $\langle value \rangle$, but must be at least $\langle value \rangle$.

NE_INT_3

On entry, **ncv** = $\langle value \rangle$, **nev** = $\langle value \rangle$ and **n** = $\langle value \rangle$.

Constraint: **ncv** > **nev** + 1 and **ncv** ≤ **n**.

NE_INTERNAL_ERROR

An internal error has occurred in this function. Check the function call and any array sizes. If the call is correct then please contact NAG for assistance.

7 Accuracy

Not applicable.

8 Parallelism and Performance

Not applicable.

9 Further Comments

None.

10 Example

The use of `nag_complex_banded_eigensystem_init` (f12atc) is illustrated in Section 10 in `nag_complex_banded_eigensystem_solve` (f12auc).
