

NAG Library Function Document

nag_dpptrs (f07gec)

1 Purpose

nag_dpptrs (f07gec) solves a real symmetric positive definite system of linear equations with multiple right-hand sides,

$$AX = B,$$

where A has been factorized by nag_dpptf (f07gdc), using packed storage.

2 Specification

```
#include <nag.h>
#include <nagf07.h>

void nag_dpptrs (Nag_OrderType order, Nag_UploType uplo, Integer n,
                Integer nrhs, const double ap[], double b[], Integer pnb,
                NagError *fail)
```

3 Description

nag_dpptrs (f07gec) is used to solve a real symmetric positive definite system of linear equations $AX = B$, the function must be preceded by a call to nag_dpptf (f07gdc) which computes the Cholesky factorization of A , using packed storage. The solution X is computed by forward and backward substitution.

If **uplo** = Nag_Upper, $A = U^T U$, where U is upper triangular; the solution X is computed by solving $U^T Y = B$ and then $UX = Y$.

If **uplo** = Nag_Lower, $A = LL^T$, where L is lower triangular; the solution X is computed by solving $LY = B$ and then $L^T X = Y$.

5 Arguments

1: **order** – Nag_OrderType *Input*

On entry: the **order** argument specifies the two-dimensional storage scheme being used, i.e., row-major ordering or column-major ordering. C language defined storage is specified by **order** = Nag_RowMajor. See Section 3.2.1.3 in the Essential Introduction for a more detailed explanation of the use of this argument.

Constraint: **order** = Nag_RowMajor or Nag_ColMajor.

2: **uplo** – Nag_UploType *Input*

On entry: specifies how A has been factorized.

uplo = Nag_Upper
 $A = U^T U$, where U is upper triangular.

uplo = Nag_Lower
 $A = LL^T$, where L is lower triangular.
 Constraint: **uplo** = Nag_Upper or Nag_Lower.

- 3: **n** – Integer *Input*
 On entry: n , the order of the matrix A .
 Constraint: $n \geq 0$.
- 4: **nrhs** – Integer *Input*
 On entry: r , the number of right-hand sides.
 Constraint: **nrhs** ≥ 0 .
- 5: **ap**[*dim*] – const double *Input*
Note: the dimension, *dim*, of the array **ap** must be at least $\max(1, n \times (n + 1)/2)$.
 On entry: the Cholesky factor of A stored in packed form, as returned by nag_dpptf (f07gdc).
- 6: **b**[*dim*] – double *Input/Output*
Note: the dimension, *dim*, of the array **b** must be at least
 $\max(1, \mathbf{pdb} \times \mathbf{nrhs})$ when **order** = Nag_ColMajor;
 $\max(1, n \times \mathbf{pdb})$ when **order** = Nag_RowMajor.
 The (i, j)th element of the matrix B is stored in
 $\mathbf{b}[(j - 1) \times \mathbf{pdb} + i - 1]$ when **order** = Nag_ColMajor;
 $\mathbf{b}[(i - 1) \times \mathbf{pdb} + j - 1]$ when **order** = Nag_RowMajor.
 On entry: the n by r right-hand side matrix B .
 On exit: the n by r solution matrix X .
- 7: **pdb** – Integer *Input*
 On entry: the stride separating row or column elements (depending on the value of **order**) in the array **b**.
 Constraints:
 if **order** = Nag_ColMajor, **pdb** $\geq \max(1, n)$;
 if **order** = Nag_RowMajor, **pdb** $\geq \max(1, \mathbf{nrhs})$.
- 8: **fail** – NagError * *Input/Output*
 The NAG error argument (see Section 3.6 in the Essential Introduction).

6 Error Indicators and Warnings

NE_ALLOC_FAIL

Dynamic memory allocation failed.

NE_BAD_PARAM

On entry, argument $\langle value \rangle$ had an illegal value.

NE_INT

On entry, $n = \langle value \rangle$.
 Constraint: $n \geq 0$.

On entry, **nrhs** = $\langle value \rangle$.

Constraint: **nrhs** ≥ 0 .

On entry, **pdb** = $\langle value \rangle$.

Constraint: **pdb** > 0 .

NE_INT_2

On entry, **pdb** = $\langle value \rangle$ and **n** = $\langle value \rangle$.

Constraint: **pdb** $\geq \max(1, \mathbf{n})$.

On entry, **pdb** = $\langle value \rangle$ and **nrhs** = $\langle value \rangle$.

Constraint: **pdb** $\geq \max(1, \mathbf{nrhs})$.

NE_INTERNAL_ERROR

An internal error has occurred in this function. Check the function call and any array sizes. If the call is correct then please contact NAG for assistance.

7 Accuracy

For each right-hand side vector b , the computed solution x is the exact solution of a perturbed system of equations $(A + E)x = b$, where

if **uplo** = Nag_Upper, $|E| \leq c(n)\epsilon|U^T|U$;

if **uplo** = Nag_Lower, $|E| \leq c(n)\epsilon|L|L^T$,

$c(n)$ is a modest linear function of n , and ϵ is the *machine precision*.

If \hat{x} is the true solution, then the computed solution x satisfies a forward error bound of the form

$$\frac{\|x - \hat{x}\|_{\infty}}{\|x\|_{\infty}} \leq c(n) \text{cond}(A, x)\epsilon$$

where $\text{cond}(A, x) = \frac{\|A^{-1}\| \|A\| \|x\|_{\infty}}{\|x\|_{\infty}} \leq \text{cond}(A) = \frac{\|A^{-1}\| \|A\|}{1} \leq \kappa_{\infty}(A)$.

Note that $\text{cond}(A, x)$ can be much smaller than $\text{cond}(A)$.

Forward and backward error bounds can be computed by calling `nag_dpprfs` (f07ghc), and an estimate for $\kappa_{\infty}(A)$ ($= \kappa_1(A)$) can be obtained by calling `nag_dppcon` (f07ggc).

8 Parallelism and Performance

`nag_dppttrs` (f07gec) is threaded by NAG for parallel execution in multithreaded implementations of the NAG Library.

`nag_dppttrs` (f07gec) makes calls to BLAS and/or LAPACK routines, which may be threaded within the vendor library used by this implementation. Consult the documentation for the vendor library for further information.

Please consult the Users' Note for your implementation for any additional implementation-specific information.

9 Further Comments

The total number of floating-point operations is approximately $2n^2r$.

This function may be followed by a call to `nag_dpprfs` (f07ghc) to refine the solution and return an error estimate.

The complex analogue of this function is `nag_zppttrs` (f07gsc).

10 Example

This example solves the system of equations $AX = B$, where

$$A = \begin{pmatrix} 4.16 & -3.12 & 0.56 & -0.10 \\ -3.12 & 5.03 & -0.83 & 1.18 \\ 0.56 & -0.83 & 0.76 & 0.34 \\ -0.10 & 1.18 & 0.34 & 1.18 \end{pmatrix} \quad \text{and} \quad B = \begin{pmatrix} 8.70 & 8.30 \\ -13.35 & 2.13 \\ 1.89 & 1.61 \\ -4.14 & 5.00 \end{pmatrix}.$$

Here A is symmetric positive definite, stored in packed form, and must first be factorized by nag_dpptrf (f07gdc).
