NAG Library Function Document

nag_1d_cheb_eval2 (e02akc)

1 Purpose

nag_1d_cheb_eval2 (e02akc) evaluates a polynomial from its Chebyshev series representation, allowing an arbitrary index increment for accessing the array of coefficients.

2 Specification

```c
#include <nag.h>
#include <nage02.h>

void nag_1d_cheb_eval2 (Integer n, double xmin, double xmax,
                        const double a[], Integer ia1, double x, double *result, NagError *fail)
```

3 Description

If supplied with the coefficients \(a_i\), for \(i = 0, 1, \ldots, n\), of a polynomial \(p(x)\) of degree \(n\), where

\[
p(x) = \frac{1}{2}a_0 + a_1 T_1(x) + \cdots + a_n T_n(x),
\]

nag_1d_cheb_eval2 (e02akc) returns the value of \(p(x)\) at a user-specified value of the variable \(x\). Here \(T_j(x)\) denotes the Chebyshev polynomial of the first kind of degree \(j\) with argument \(x\). It is assumed that the independent variable \(\bar{x}\) in the interval \([-1, 1]\) was obtained from your original variable \(x\) in the interval \([x_{\text{min}}, x_{\text{max}}]\) by the linear transformation

\[
\bar{x} = \frac{2x - (x_{\text{max}} + x_{\text{min}})}{x_{\text{max}} - x_{\text{min}}}
\]

The coefficients \(a_i\) may be supplied in the array \(a\), with any increment between the indices of array elements which contain successive coefficients. This enables the function to be used in surface fitting and other applications, in which the array might have two or more dimensions.

The method employed is based on the three-term recurrence relation due to Clenshaw (see Clenshaw (1955)), with modifications due to Reinsch and Gentleman (see Gentleman (1969)). For further details of the algorithm and its use see Cox (1973) and Cox and Hayes (1973).

5 Arguments

1:  \(n\) – Integer  

   \(\text{Input}\)

   \(\text{On entry: } n, \text{ the degree of the given polynomial } p(\bar{x}).\)

   \(\text{Constraint: } n \geq 0.\)
2:  **xmin** – double  
*Input*

3:  **xmax** – double  
*Input*

*On entry:* the lower and upper end points respectively of the interval \([x_{\text{min}}, x_{\text{max}}]\). The Chebyshev series representation is in terms of the normalized variable \(\bar{x}\), where

\[
\bar{x} = \frac{2x - (x_{\text{max}} + x_{\text{min}})}{x_{\text{max}} - x_{\text{min}}}
\]

*Constraint:* \(x_{\text{min}} < x_{\text{max}}\).

4:  **a[dim]** – const double  
*Input*

*Note:* the dimension, \(dim\), of the array \(a\) must be at least \(((n + 1 - 1) \times ia1 + 1)\).

*On entry:* the Chebyshev coefficients of the polynomial \(p(\bar{x})\). Specifically, element \(i \times ia1\) must contain the coefficient \(a_i\), for \(i = 0, 1, \ldots, n\). Only these \(n + 1\) elements will be accessed.

5:  **ia1** – Integer  
*Input*

*On entry:* the index increment of \(a\). Most frequently, the Chebyshev coefficients are stored in adjacent elements of \(a\), and \(ia1\) must be set to 1. However, if, for example, they are stored in \(a[0], a[3], a[6], \ldots\), then the value of \(ia1\) must be 3.

*Constraint:* \(ia1 \geq 1\).

6:  **x** – double  
*Input*

*On entry:* the argument \(x\) at which the polynomial is to be evaluated.

*Constraint:* \(x_{\text{min}} \leq x \leq x_{\text{max}}\).

7:  **result** – double *  
*Output*

*On exit:* the value of the polynomial \(p(\bar{x})\).

8:  **fail** – NagError *  
*Input/Output*

The NAG error argument (see Section 3.6 in the Essential Introduction).

### 6 Error Indicators and Warnings

**NE_ALLOC_FAIL**
Dynamic memory allocation failed.
See Section 3.2.1.2 in the Essential Introduction for further information.

**NE_BAD_PARAM**
On entry, argument \(\langle\text{value}\rangle\) had an illegal value.

**NE_INT**

On entry, \(ia1 = \langle\text{value}\rangle\).
*Constraint:* \(ia1 \geq 1\).

On entry, \(n + 1 = \langle\text{value}\rangle\).
*Constraint:* \(n + 1 \geq 1\).

On entry, \(n = \langle\text{value}\rangle\).
*Constraint:* \(n \geq 0\).

**NE_INTERNAL_ERROR**
An internal error has occurred in this function. Check the function call and any array sizes. If the call is correct then please contact NAG for assistance.
An unexpected error has been triggered by this function. Please contact NAG. See Section 3.6.6 in the Essential Introduction for further information.

**NE_NO_LICENCE**

Your licence key may have expired or may not have been installed correctly. See Section 3.6.5 in the Essential Introduction for further information.

**NE_REAL_2**

On entry, $\text{xmax} = \langle \text{value} \rangle$ and $\text{xmin} = \langle \text{value} \rangle$.
Constraint: $\text{xmax} > \text{xmin}$.

**NE_REAL_3**

On entry, $x$ does not lie in $[\text{xmin, xmax}]$: $x = \langle \text{value} \rangle$, $\text{xmin} = \langle \text{value} \rangle$ and $\text{xmax} = \langle \text{value} \rangle$.

### 7 Accuracy

The rounding errors are such that the computed value of the polynomial is exact for a slightly perturbed set of coefficients $a_i + ba_i$. The ratio of the sum of the absolute values of the $ba_i$ to the sum of the absolute values of the $a_i$ is less than a small multiple of $(n + 1) \times \text{machine precision}$.

### 8 Parallelism and Performance

Not applicable.

### 9 Further Comments

The time taken is approximately proportional to $n + 1$.

### 10 Example

Suppose a polynomial has been computed in Chebyshev series form to fit data over the interval $[-0.5, 2.5]$. The following program evaluates the polynomial at 4 equally spaced points over the interval.
(For the purposes of this example, $\text{xmin, xmax}$ and the Chebyshev coefficients are supplied. Normally a program would first read in or generate data and compute the fitted polynomial.)

```c
/* nag_1d_cheb_eval2 (e02akc) Example Program. */
/* Copyright 2014 Numerical Algorithms Group. */
/* Mark 7, 2001. */

#include <stdio.h>
#include <nag.h>
#include <nag_stdlib.h>
#include <nage02.h>

int main(void) {
    /* Initialized data */
    const double xmin = -0.5;
    const double xmax = 2.5;
    const double a[7] = { 2.53213, 1.13032, 0.2715, 0.04434, 0.00547, 5.4e-4, 4e-5 };

    /* Scalars */
    double p, x;
    Integer exit_status, i, m, n, one;
```
NagError fail;
INIT_FAIL(fail);

exit_status = 0;
printf("nag_1d_cheb_eval2 (e02akc) Example Program Results\n");
n = 6;
one = 1;
printf("\n");
printf(" i Argument Value of polynomial\n");
m = 4;
for (i = 1; i <= m; ++i)
{
    x = (xmin * (double)(m - i) + xmax * (double)(i - 1)) / (double)(m - 1);
    /* nag_1d_cheb_eval2 (e02akc).
     * Evaluation of fitted polynomial in one variable from
     * Chebyshev series form
     */
    nag_1d_cheb_eval2(n, xmin, xmax, a, one, x, &p, &fail);
    if (fail.code != NE_NOERROR)
    {
        printf("Error from nag_1d_cheb_eval2 (e02akc).\n%s\n", fail.message);
        exit_status = 1;
        goto END;
    }
    printf("%4"NAG_IFMT"%10.4f %9.4f\n", i, x, p);
}

END:
return exit_status;

10.2 Program Data
None.

10.3 Program Results
nag_1d_cheb_eval2 (e02akc) Example Program Results
