NAG Library Function Document

nag_real_sym_posdef_band_lin_solve (f04bfc)

1 Purpose

nag_real_sym_posdef_band_lin_solve (f04bfc) computes the solution to a real system of linear equations

\[ AX = B, \]

where \( A \) is an \( n \) by \( n \) symmetric positive definite band matrix of band width \( 2k + 1 \), and \( X \) and \( B \) are \( n \) by \( r \) matrices. An estimate of the condition number of \( A \) and an error bound for the computed solution are also returned.

2 Specification

```c
#include <nag.h>
#include <nagf04.h>
void nag_real_sym_posdef_band_lin_solve (Nag_OrderType order,
                                      Nag_UploType uplo, Integer n, Integer kd, Integer nrhs,
                                      double ab[], Integer pdab, double b[], Integer pdb,
                                      double *rcond, double *errbnd, NagError *fail)
```

3 Description

The Cholesky factorization is used to factor \( A \) as \( A = U^T U \), if \( \text{uplo} = \text{NagUpper} \), or \( A = LL^T \), if \( \text{uplo} = \text{NagLower} \), where \( U \) is an upper triangular band matrix with \( k \) superdiagonals, and \( L \) is a lower triangular band matrix with \( k \) subdiagonals. The factored form of \( A \) is then used to solve the system of equations \( AX = B \).

4 References

5 Arguments

1:  order – Nag_OrderType

   On entry: the order argument specifies the two-dimensional storage scheme being used, i.e., row-major ordering or column-major ordering. C language defined storage is specified by \( \text{order} = \text{NagRowMajor} \). See Section 3.2.1.3 in the Essential Introduction for a more detailed explanation of the use of this argument.

   Constraint: \( \text{order} = \text{NagRowMajor} \) or \( \text{NagColMajor} \).

2:  uplo – Nag_UploType

   On entry: if \( \text{uplo} = \text{NagUpper} \), the upper triangle of the matrix \( A \) is stored.

   If \( \text{uplo} = \text{NagLower} \), the lower triangle of the matrix \( A \) is stored.

   Constraint: \( \text{uplo} = \text{NagUpper} \) or \( \text{NagLower} \).

3:  n – Integer

   On entry: the number of linear equations \( n \), i.e., the order of the matrix \( A \).

   Constraint: \( n \geq 0 \).

Mark 25
4: \( \text{kd} \) – Integer

*Input*

*On entry:* the number of superdiagonals \( k \) (and the number of subdiagonals) of the band matrix \( A \).

*Constraint:* \( \text{kd} \geq 0 \).

5: \( \text{nrhs} \) – Integer

*Input*

*On entry:* the number of right-hand sides \( r \), i.e., the number of columns of the matrix \( B \).

*Constraint:* \( \text{nrhs} \geq 0 \).

6: \( \text{ab}[\text{dim}] \) – double

*Input/Output*

*Note:* the dimension, \( \text{dim} \), of the array \( \text{ab} \) must be at least \( \max(1, \text{pdab} \times n) \).

*On entry:*

\[
\begin{align*}
\text{if } \text{uplo} & = \text{Nag\_Upper} \text{ then } \\
\text{if } \text{order} & = \text{Nag\_ColMajor}, \ a_{ij} \text{ is stored in } \text{ab}[(j - 1) \times \text{pdab} + \text{kd} + i - j]; \\
\text{if } \text{order} & = \text{Nag\_RowMajor}, \ a_{ij} \text{ is stored in } \text{ab}[(i - 1) \times \text{pdab} + i - j], \\
& \text{for } \max(1, j - \text{kd}) \leq i \leq j; \\
\text{if } \text{uplo} & = \text{Nag\_Lower} \text{ then } \\
\text{if } \text{order} & = \text{Nag\_ColMajor}, \ a_{ij} \text{ is stored in } \text{ab}[(j - 1) \times \text{pdab} + i - j]; \\
\text{if } \text{order} & = \text{Nag\_RowMajor}, \ a_{ij} \text{ is stored in } \text{ab}[(i - 1) \times \text{pdab} + \text{kd} + j - i], \\
& \text{for } j \leq i \leq \min(n, j + \text{kd}),
\end{align*}
\]

where \( \text{pdab} \geq \text{kd} + 1 \) is the stride separating diagonal matrix elements in the array \( \text{ab} \).

See Section 9 below for further details.

*On exit:* if \( \text{fail.code} = \text{NE\_NOERROR} \) or \( \text{NE\_RCOND} \), the factor \( U \) or \( L \) from the Cholesky factorization \( A = U^T U \) or \( A = L L^T \), in the same storage format as \( A \).

7: \( \text{pdab} \) – Integer

*Input*

*On entry:* the stride separating row or column elements (depending on the value of \( \text{order} \)) of the matrix \( A \) in the array \( \text{ab} \).

*Constraint:* \( \text{pdab} \geq \text{kd} + 1 \).

8: \( \text{b}[\text{dim}] \) – double

*Input/Output*

*Note:* the dimension, \( \text{dim} \), of the array \( \text{b} \) must be at least

\[
\begin{align*}
\max(1, \text{pdb} \times \text{nrhs}) \text{ when } \text{order} & = \text{Nag\_ColMajor}; \\
\max(1, n \times \text{pdb}) \text{ when } \text{order} & = \text{Nag\_RowMajor}.
\end{align*}
\]

The \((i,j)\)th element of the matrix \( B \) is stored in

\[
\begin{align*}
\text{b}[(j - 1) \times \text{pdb} + i - 1] \text{ when } \text{order} & = \text{Nag\_ColMajor}; \\
\text{b}[(i - 1) \times \text{pdb} + j - 1] \text{ when } \text{order} & = \text{Nag\_RowMajor}.
\end{align*}
\]

*On entry:* the \( n \) by \( r \) matrix of right-hand sides \( B \).

*On exit:* if \( \text{fail.code} = \text{NE\_NOERROR} \) or \( \text{NE\_RCOND} \), the \( n \) by \( r \) solution matrix \( X \).

9: \( \text{pdb} \) – Integer

*Input*

*On entry:* the stride separating row or column elements (depending on the value of \( \text{order} \)) in the array \( \text{b} \).
Constraints:
if \texttt{order} = \texttt{Nag\_ColMajor}, \texttt{pdb} \geq \max(1, n);
if \texttt{order} = \texttt{Nag\_RowMajor}, \texttt{pdb} \geq \max(1, \texttt{nrhs}).

10: \texttt{rcond} – double *
\textit{Output}
\textit{On exit: if} \texttt{fail\_code} = \texttt{NE\_NOERROR} or \texttt{NE\_RCOND}, an estimate of the reciprocal of the condition number of the matrix \(A\), computed as \(\texttt{rcond} = 1/\left(\|A\|_1\|A^{-1}\|_1\right)\).

11: \texttt{errbnd} – double *
\textit{Output}
\textit{On exit: if} \texttt{fail\_code} = \texttt{NE\_NOERROR} or \texttt{NE\_RCOND}, an estimate of the forward error bound for a computed solution \(\hat{x}\), such that \(\|\hat{x} - x\|_1/\|x\|_1 \leq \texttt{errbnd}\), where \(\hat{x}\) is a column of the computed solution returned in the array \(b\) and \(x\) is the corresponding column of the exact solution \(X\). If \texttt{rcond} is less than \textit{machine precision}, then \texttt{errbnd} is returned as unity.

12: \texttt{fail} – NagError *
\textit{Input/Output}
The NAG error argument (see Section 3.6 in the Essential Introduction).

6 Error Indicators and Warnings

\textbf{NE\_ALLOC\_FAIL}
Dynamic memory allocation failed.
See Section 3.2.1.2 in the Essential Introduction for further information.

\textbf{NE\_BAD\_PARAM}
On entry, argument \langle\textit{value}\rangle had an illegal value.

\textbf{NE\_INT}
On entry, \(\texttt{kd} = \langle\textit{value}\rangle\).
Constraint: \(\texttt{kd} \geq 0\).

On entry, \(\texttt{n} = \langle\textit{value}\rangle\).
Constraint: \(\texttt{n} \geq 0\).

On entry, \(\texttt{nrhs} = \langle\textit{value}\rangle\).
Constraint: \(\texttt{nrhs} \geq 0\).

On entry, \(\texttt{pdab} = \langle\textit{value}\rangle\).
Constraint: \(\texttt{pdab} > 0\).

On entry, \(\texttt{pdb} = \langle\textit{value}\rangle\).
Constraint: \(\texttt{pdb} > 0\).

\textbf{NE\_INT\_2}
On entry, \(\texttt{pdab} = \langle\textit{value}\rangle\) and \(\texttt{kd} = \langle\textit{value}\rangle\).
Constraint: \(\texttt{pdab} \geq \texttt{kd} + 1\).

On entry, \(\texttt{pdb} = \langle\textit{value}\rangle\) and \(\texttt{n} = \langle\textit{value}\rangle\).
Constraint: \(\texttt{pdb} \geq \max(1, \texttt{n})\).

On entry, \(\texttt{pdb} = \langle\textit{value}\rangle\) and \(\texttt{nrhs} = \langle\textit{value}\rangle\).
Constraint: \(\texttt{pdb} \geq \max(1, \texttt{nrhs})\).

\textbf{NE\_INTERNAL\_ERROR}
An internal error has occurred in this function. Check the function call and any array sizes. If the call is correct then please contact NAG for assistance.
An unexpected error has been triggered by this function. Please contact NAG. See Section 3.6.6 in the Essential Introduction for further information.

**NE_NO_LICENCE**

Your licence key may have expired or may not have been installed correctly. See Section 3.6.5 in the Essential Introduction for further information.

**NE_POS_DEF**

The principal minor of order \(\text{value}\) of the matrix \(A\) is not positive definite. The factorization has not been completed and the solution could not be computed.

**NE_RCOND**

A solution has been computed, but \(\text{rcond}\) is less than \textit{machine precision} so that the matrix \(A\) is numerically singular.

7 Accuracy

The computed solution for a single right-hand side, \(\hat{x}\), satisfies an equation of the form

\[
(A + E)\hat{x} = b,
\]

where

\[
\|E\|_1 = O(\epsilon)\|A\|_1
\]

and \(\epsilon\) is the \textit{machine precision}. An approximate error bound for the computed solution is given by

\[
\frac{\|\hat{x} - x\|_1}{\|x\|_1} \leq \kappa(A)\frac{\|E\|_1}{\|A\|_1},
\]

where \(\kappa(A) = \|A^{-1}\|_1\|A\|_1\), the condition number of \(A\) with respect to the solution of the linear equations. \texttt{nag_real_sym_posdef_band_lin_solve} uses the approximation \(\|E\|_1 = \epsilon\|A\|_1\) to estimate \texttt{errbnd}. See Section 4.4 of Anderson \textit{et al.} (1999) for further details.

8 Parallelism and Performance

\texttt{nag_real_sym_posdef_band_lin_solve} is threaded by NAG for parallel execution in multi-threaded implementations of the NAG Library.

\texttt{nag_real_sym_posdef_band_lin_solve} makes calls to BLAS and/or LAPACK routines, which may be threaded within the vendor library used by this implementation. Consult the documentation for the vendor library for further information.

Please consult the X06 Chapter Introduction for information on how to control and interrogate the OpenMP environment used within this function. Please also consult the Users’ Note for your implementation for any additional implementation-specific information.

9 Further Comments

The Integer allocatable memory required is \(n\), and the double allocatable memory required is \(3 \times n\). Allocation failed before the solution could be computed.

The band storage schemes for the array \(ab\) are identical to the storage schemes for symmetric and Hermitian band matrices in Chapter f07. See Section 3.3.4 in the f07 Chapter Introduction for details of the storage schemes and an illustrated example.

If \(\text{uplo} = \text{Nag_Upper}\) then the elements of the stored upper triangular part of \(A\) are overwritten by the corresponding elements of the upper triangular matrix \(U\). Similarly, if \(\text{uplo} = \text{Nag_Lower}\) then the elements of the stored lower triangular part of \(A\) are overwritten by the corresponding elements of the lower triangular matrix \(L\).
Assuming that $n \gg k$, the total number of floating-point operations required to solve the equations $AX = B$ is approximately $n(k+1)^2$ for the factorization and $4nkr$ for the solution following the factorization. The condition number estimation typically requires between four and five solves and never more than eleven solves, following the factorization.

In practice the condition number estimator is very reliable, but it can underestimate the true condition number; see Section 15.3 of Higham (2002) for further details.

The complex analogue of nag_real_sym_posdef_band_lin_solve (f04bfc) is nag_herm_posdef_band_lin_solve (f04cfc).

10 Example

This example solves the equations $AX = B$,

where $A$ is the symmetric positive definite band matrix

$$A = \begin{pmatrix} 5.49 & 2.68 & 0 & 0 \\ 2.68 & 5.63 & -2.39 & 0 \\ 0 & -2.39 & 2.60 & -2.22 \\ 0 & 0 & -2.22 & 5.17 \end{pmatrix} \quad \text{and} \quad B = \begin{pmatrix} 22.09 & 5.10 \\ 9.31 & 30.81 \\ -5.24 & -25.82 \\ 11.83 & 22.90 \end{pmatrix}.$$

An estimate of the condition number of $A$ and an approximate error bound for the computed solutions are also printed.
