NAG Library Function Document

nag_herm_posdef_tridiag_lin_solve (f04cgc)

1 Purpose

nag_herm_posdef_tridiag_lin_solve (f04cgc) computes the solution to a complex system of linear equations $AX = B$, where $A$ is an $n$ by $n$ Hermitian positive definite tridiagonal matrix and $X$ and $B$ are $n$ by $r$ matrices. An estimate of the condition number of $A$ and an error bound for the computed solution are also returned.

2 Specification

```c
#include <nag.h>
#include <nagf04.h>
void nag_herm_posdef_tridiag_lin_solve (Nag_OrderType order, Integer n, 
  Integer nrhs, double d[], Complex e[], Complex b[], Integer pdb, 
  double *rcond, double *errbnd, NagError *fail)
```

3 Description

$A$ is factorized as $A = LDL^H$, where $L$ is a unit lower bidiagonal matrix and $D$ is a real diagonal matrix, and the factored form of $A$ is then used to solve the system of equations.

4 References

5 Arguments

1:  
   **order** – Nag_OrderType  
   
   *Input*  
   
   *On entry:* the **order** argument specifies the two-dimensional storage scheme being used, i.e., row-major ordering or column-major ordering. C language defined storage is specified by **order** = Nag_RowMajor. See Section 3.2.1.3 in the Essential Introduction for a more detailed explanation of the use of this argument.  
   
   *Constraint:* **order** = Nag_RowMajor or Nag_ColMajor.

2:  
   **n** – Integer  
   
   *Input*  
   
   *On entry:* the number of linear equations $n$, i.e., the order of the matrix $A$.  
   
   *Constraint:* $n \geq 0$.

3:  
   **nrhs** – Integer  
   
   *Input*  
   
   *On entry:* the number of right-hand sides $r$, i.e., the number of columns of the matrix $B$.  
   
   *Constraint:* $nrhs \geq 0$.

4:  
   **d[\text{dim}]** – double  
   
   *Input/Output*  
   
   *Note:* the dimension, $\text{dim}$, of the array $\text{d}$ must be at least max(1, $n$).
On entry: must contain the \( n \) diagonal elements of the tridiagonal matrix \( A \).

On exit: if \( \text{fail.code} = \text{NE_NOERROR} \) or \( \text{NE_RCOND} \), \( d \) is overwritten by the \( n \) diagonal elements of the diagonal matrix \( D \) from the \( LDL^H \) factorization of \( A \).

5: \( e[\text{dim}] \) – Complex \hspace{1cm} \text{Input/Output}

\textbf{Note:} the dimension, \( \text{dim} \), of the array \( e \) must be at least \( \max(1, n-1) \).

On entry: must contain the \( (n-1) \) subdiagonal elements of the tridiagonal matrix \( A \).

On exit: if \( \text{fail.code} = \text{NE_NOERROR} \) or \( \text{NE_RCOND} \), \( e \) is overwritten by the \( (n-1) \) subdiagonal elements of the unit lower bidiagonal matrix \( L \) from the \( LDL^H \) factorization of \( A \). (\( e \) can also be regarded as the conjugate of the superdiagonal of the unit upper bidiagonal factor \( U \) from the \( U^H D U \) factorization of \( A \).)

6: \( b[\text{dim}] \) – Complex \hspace{1cm} \text{Input/Output}

\textbf{Note:} the dimension, \( \text{dim} \), of the array \( b \) must be at least \( \max(1, \text{pdb}\times \text{nrhs}) \) when \( \text{order} = \text{Nag_ColMajor} \); \( \max(1, n \times \text{pdb}) \) when \( \text{order} = \text{Nag_RowMajor} \).

The \((i,j)\)th element of the matrix \( B \) is stored in

\[
\begin{align*}
b[(j-1) \times \text{pdb} + i - 1] & \quad \text{when } \text{order} = \text{Nag_ColMajor}; \\
b[(i-1) \times \text{pdb} + j - 1] & \quad \text{when } \text{order} = \text{Nag_RowMajor}.
\end{align*}
\]

On entry: the \( n \) by \( r \) matrix of right-hand sides \( B \).

On exit: if \( \text{fail.code} = \text{NE_NOERROR} \) or \( \text{NE_RCOND} \), the \( n \) by \( r \) solution matrix \( X \).

7: \( \text{pdb} \) – Integer \hspace{1cm} \text{Input}

On entry: the stride separating row or column elements (depending on the value of \( \text{order} \)) in the array \( b \).

\textbf{Constraints:}

\[
\begin{align*}
\text{if } \text{order} = \text{Nag_ColMajor}, & \quad \text{pdb} \geq \max(1, n); \\
\text{if } \text{order} = \text{Nag_RowMajor}, & \quad \text{pdb} \geq \max(1, \text{nrhs}).
\end{align*}
\]

8: \( \text{rcond} \) – double * \hspace{1cm} \text{Output}

On exit: if \( \text{fail.code} = \text{NE_NOERROR} \) or \( \text{NE_RCOND} \), an estimate of the reciprocal of the condition number of the matrix \( A \), computed as \( \text{rcond} = 1/\left(\| A \|_1, \| A^{-1} \|_1 \right) \).

9: \( \text{errbnd} \) – double * \hspace{1cm} \text{Output}

On exit: if \( \text{fail.code} = \text{NE_NOERROR} \) or \( \text{NE_RCOND} \), an estimate of the forward error bound for a computed solution \( \hat{x} \), such that \( \| \hat{x} - x \|_1/\| x \|_1 \leq \text{errbnd} \), where \( \hat{x} \) is a column of the computed solution returned in the array \( b \) and \( x \) is the corresponding column of the exact solution \( X \). If \( \text{rcond} \) is less than \text{machine precision}, then \( \text{errbnd} \) is returned as unity.

10: \( \text{fail} \) – \text{NagError} * \hspace{1cm} \text{Input/Output}

The NAG error argument (see Section 3.6 in the Essential Introduction).

6 \ Error Indicators and Warnings

\textbf{NE_ALLOC_FAIL}

Dynamic memory allocation failed.

See Section 3.2.1.2 in the Essential Introduction for further information.
NE_BAD_PARAM

On entry, argument \(\langle\text{value}\rangle\) had an illegal value.

NE_INT

On entry, \(n = \langle\text{value}\rangle\).
Constraint: \(n \geq 0\).

On entry, \(\text{nrhs} = \langle\text{value}\rangle\).
Constraint: \(\text{nrhs} \geq 0\).

On entry, \(\text{pdb} = \langle\text{value}\rangle\).
Constraint: \(\text{pdb} > 0\).

NE_INT_2

On entry, \(\text{pdb} = \langle\text{value}\rangle\) and \(n = \langle\text{value}\rangle\).
Constraint: \(\text{pdb} \geq \max(1, n)\).

On entry, \(\text{pdb} = \langle\text{value}\rangle\) and \(\text{nrhs} = \langle\text{value}\rangle\).
Constraint: \(\text{pdb} \geq \max(1, \text{nrhs})\).

NE_INTERNAL_ERROR

An internal error has occurred in this function. Check the function call and any array sizes. If the
call is correct then please contact NAG for assistance.

An unexpected error has been triggered by this function. Please contact NAG.
See Section 3.6.6 in the Essential Introduction for further information.

NE_NO_LICENCE

Your licence key may have expired or may not have been installed correctly.
See Section 3.6.5 in the Essential Introduction for further information.

NE_POS_DEF

The principal minor of order \(\langle\text{value}\rangle\) of the matrix \(A\) is not positive definite. The factorization has
not been completed and the solution could not be computed.

NE_RCOND

A solution has been computed, but \(\text{rcond}\) is less than \textit{machine precision} so that the matrix \(A\) is
numerically singular.

7 Accuracy

The computed solution for a single right-hand side, \(\hat{x}\), satisfies an equation of the form

\[(A + E)\hat{x} = b,\]

where

\[\|E\|_1 = O(\epsilon)\|A\|_1\]

and \(\epsilon\) is the \textit{machine precision}. An approximate error bound for the computed solution is given by

\[\frac{\|\hat{x} - x\|_1}{\|x\|_1} \leq \kappa(A)\|E\|_1,\]

where \(\kappa(A) = \|A^{-1}\|_1\|A\|_1\), the condition number of \(A\) with respect to the solution of the linear
equations. \texttt{nag_herm_posdef_tridiag_lin_solve} (f04cgc) uses the approximation \(\|E\|_1 = \epsilon\|A\|_1\) to estimate \texttt{errbnd}. See Section 4.4 of Anderson \textit{et al.} (1999) for further details.
8 Parallelism and Performance

nag_herm_posdef_tridiag_lin_solve (f04cgc) is not threaded by NAG in any implementation.
nag_herm_posdef_tridiag_lin_solve (f04cgc) makes calls to BLAS and/or LAPACK routines, which may be threaded within the vendor library used by this implementation. Consult the documentation for the vendor library for further information.

Please consult the X06 Chapter Introduction for information on how to control and interrogate the OpenMP environment used within this function. Please also consult the Users’ Note for your implementation for any additional implementation-specific information.

9 Further Comments

The double allocatable memory required is n. In this case the factorization and the solution X have been computed, but rcond and errbnd have not been computed.

The total number of floating-point operations required to solve the equations AX = B is proportional to nr. The condition number estimation requires \( O(n) \) floating-point operations.

See Section 15.3 of Higham (2002) for further details on computing the condition number of tridiagonal matrices.

The real analogue of nag_herm_posdef_tridiag_lin_solve (f04cgc) is nag_real_sym_posdef_tridiag_lin_solve (f04bgc).

10 Example

This example solves the equations

\[ AX = B, \]

where A is the Hermitian positive definite tridiagonal matrix

\[
A = \begin{pmatrix}
16.0 & 16.0 + 16.0i & 0 & 0 \\
16.0 - 16.0i & 41.0 & 18.0 - 9.0i & 0 \\
0 & 18.0 + 9.0i & 46.0 & 1.0 - 4.0i \\
0 & 0 & 1.0 + 4.0i & 21.0
\end{pmatrix}
\]

and

\[
B = \begin{pmatrix}
64.0 + 16.0i & -16.0 - 32.0i \\
93.0 + 62.0i & 61.0 - 66.0i \\
78.0 - 80.0i & 71.0 - 74.0i \\
14.0 - 27.0i & 35.0 + 15.0i
\end{pmatrix}.
\]

An estimate of the condition number of A and an approximate error bound for the computed solutions are also printed.
