NAG Library Function Document

nag_zgetrs (f07asc)

1 Purpose

nag_zgetrs (f07asc) solves a complex system of linear equations with multiple right-hand sides,

\[ AX = B, \quad A^T X = B \quad \text{or} \quad A^H X = B, \]

where \( A \) has been factorized by nag_zgetrf (f07arc).

2 Specification

```
#include <nag.h>
#include <nagf07.h>

void nag_zgetrs (Nag_OrderType order, Nag_TransType trans, Integer n, Integer nrhs, const Complex a[], Integer pda, const Integer ipiv[], Complex b[], Integer pdb, NagError *fail)
```

3 Description

nag_zgetrs (f07asc) is used to solve a complex system of linear equations \( AX = B, \quad A^T X = B \) or \( A^H X = B \), the function must be preceded by a call to nag_zgetrf (f07arc) which computes the \( LU \) factorization of \( A \) as \( A = PLU \). The solution is computed by forward and backward substitution.

If \( \text{trans} = \text{Nag}_\text{NoTrans} \), the solution is computed by solving \( PLY = B \) and then \( UX = Y \).

If \( \text{trans} = \text{Nag}_\text{Trans} \), the solution is computed by solving \( U^T Y = B \) and then \( L^T P^T X = Y \).

If \( \text{trans} = \text{Nag}_\text{ConjTrans} \), the solution is computed by solving \( U^H Y = B \) and then \( L^H P^T X = Y \).

4 References

5 Arguments

1: \( \text{order} \) – Nag_OrderType

\[ \text{Input} \]

On entry: the \text{order} argument specifies the two-dimensional storage scheme being used, i.e., row-major ordering or column-major ordering. C language defined storage is specified by \text{order} = \text{Nag}_\text{RowMajor}. See Section 3.2.1.3 in the Essential Introduction for a more detailed explanation of the use of this argument.

\[ \text{Constraint: order} = \text{Nag}_\text{RowMajor} \text{ or } \text{Nag}_\text{ColMajor}. \]

2: \( \text{trans} \) – Nag_TransType

\[ \text{Input} \]

On entry: indicates the form of the equations.

\( \text{trans} = \text{Nag}_\text{NoTrans} \)

\( AX = B \) is solved for \( X \).

\( \text{trans} = \text{Nag}_\text{Trans} \)

\( A^T X = B \) is solved for \( X \).
trans = Nag_ConjTrans
A^tX = B is solved for X.

Constraint: trans = Nag_NoTrans, Nag_TRANS or Nag_ConjTrans.

3:  n – Integer
    On entry: n, the order of the matrix A.
    Constraint: n ≥ 0.

4:  nrhs – Integer
    On entry: r, the number of right-hand sides.
    Constraint: nrhs ≥ 0.

5:  a[dim] – const Complex
    On entry: the LU factorization of A, as returned by nag_zgetrf (f07arc).

7:  ipiv[dim] – const Integer
    On entry: the pivot indices, as returned by nag_zgetrf (f07arc).

8:  b[dim] – Complex
    On entry: the n by r right-hand side matrix B.
    On exit: the n by r solution matrix X.

Constraints:
if order = Nag_ColMajor, pdb ≥ max(1, n);
if order = Nag_RowMajor, pdb ≥ max(1, nrhs).
6 Error Indicators and Warnings

**NE_ALLOC_FAIL**
Dynamic memory allocation failed.
See Section 3.2.1.2 in the Essential Introduction for further information.

**NE_BAD_PARAM**
On entry, argument \(\langle\text{value}\rangle\) had an illegal value.

**NE_INT**
On entry, \(n = \langle\text{value}\rangle\).
Constraint: \(n \geq 0\).
On entry, \(\text{nrhs} = \langle\text{value}\rangle\).
Constraint: \(\text{nrhs} \geq 0\).
On entry, \(\text{pda} = \langle\text{value}\rangle\).
Constraint: \(\text{pda} > 0\).
On entry, \(\text{pdb} = \langle\text{value}\rangle\).
Constraint: \(\text{pdb} > 0\).

**NE_INT_2**
On entry, \(\text{pda} = \langle\text{value}\rangle\) and \(n = \langle\text{value}\rangle\).
Constraint: \(\text{pda} \geq \text{max}(1, n)\).
On entry, \(\text{pdb} = \langle\text{value}\rangle\) and \(n = \langle\text{value}\rangle\).
Constraint: \(\text{pdb} \geq \text{max}(1, n)\).
On entry, \(\text{pdb} = \langle\text{value}\rangle\) and \(\text{nrhs} = \langle\text{value}\rangle\).
Constraint: \(\text{pdb} \geq \text{max}(1, \text{nrhs})\).

**NE_INTERNAL_ERROR**
An internal error has occurred in this function. Check the function call and any array sizes. If the call is correct then please contact NAG for assistance.
An unexpected error has been triggered by this function. Please contact NAG.
See Section 3.6.6 in the Essential Introduction for further information.

**NE_NO_LICENCE**
Your licence key may have expired or may not have been installed correctly.
See Section 3.6.5 in the Essential Introduction for further information.

7 Accuracy

For each right-hand side vector \(b\), the computed solution \(x\) is the exact solution of a perturbed system of equations \((A + E)x = b\), where

\[
|E| \leq c(n)\epsilon P\|L\|U,
\]

\(c(n)\) is a modest linear function of \(n\), and \(\epsilon\) is the **machine precision**.
If \( \hat{x} \) is the true solution, then the computed solution \( x \) satisfies a forward error bound of the form
\[
\frac{\|x - \hat{x}\|_{\infty}}{\|x\|_{\infty}} \leq c(n) \text{cond}(A, x)\epsilon
\]
where \( \text{cond}(A, x) = \frac{\|A^{-1}\|_{\infty}\|x\|_{\infty}}{\|x\|_{\infty}} \leq \text{cond}(A) = \frac{\|A^{-1}\|_{\infty}\|A\|_{\infty}}{\|x\|_{\infty}} \leq \kappa_\infty(A) \).

Note that \( \text{cond}(A, x) \) can be much smaller than \( \text{cond}(A) \), and \( \text{cond}(A^H) \) (which is the same as \( \text{cond}(A^T) \)) can be much larger (or smaller) than \( \text{cond}(A) \). Forward and backward error bounds can be computed by calling \text{nag_zgerfs} (f07avc), and an estimate for \( \kappa_\infty(A) \) can be obtained by calling \text{nag_zgecon} (f07auc) with \text{norm} = \text{Nag_InfNorm}.

8 Parallelism and Performance

\text{nag_zgetrs} (f07asc) is threaded by NAG for parallel execution in multithreaded implementations of the NAG Library.

\text{nag_zgetrs} (f07asc) makes calls to BLAS and/or LAPACK routines, which may be threaded within the vendor library used by this implementation. Consult the documentation for the vendor library for further information.

Please consult the X06 Chapter Introduction for information on how to control and interrogate the OpenMP environment used within this function. Please also consult the Users’ Note for your implementation for any additional implementation-specific information.

9 Further Comments

The total number of real floating-point operations is approximately \( 8n^2r \).

This function may be followed by a call to \text{nag_zgerfs} (f07avc) to refine the solution and return an error estimate.

The real analogue of this function is \text{nag_dgetrs} (f07aec).

10 Example

This example solves the system of equations \( AX = B \), where
\[
A = \begin{pmatrix}
-1.34 + 2.55i & 0.28 + 3.17i & -6.39 - 2.20i & 0.72 - 0.92i \\
-0.17 - 1.41i & 3.31 - 0.15i & -0.15 + 1.34i & 1.29 + 1.38i \\
-3.29 - 2.39i & -1.91 + 4.42i & -0.14 - 1.35i & 1.72 + 1.35i \\
2.41 + 0.39i & -0.56 + 1.47i & -0.83 - 0.69i & -1.96 + 0.67i
\end{pmatrix}
\]
and
\[
B = \begin{pmatrix}
26.26 + 51.78i & 31.32 - 6.70i \\
6.43 - 8.68i & 15.86 - 1.42i \\
-5.75 + 25.31i & -2.15 + 30.19i \\
1.16 + 2.57i & -2.56 + 7.55i
\end{pmatrix}.
\]

Here \( A \) is nonsymmetric and must first be factorized by \text{nag_zgetrf} (f07arc).
