NAG Library Function Document

nag_zgerfs (f07avc)

1 Purpose

nag_zgerfs (f07avc) returns error bounds for the solution of a complex system of linear equations with multiple right-hand sides, \(AX = B\), \(A^TX = B\) or \(A^HX = B\). It improves the solution by iterative refinement, in order to reduce the backward error as much as possible.

2 Specification

```c
#include <nag.h>
#include <nagf07.h>
void nag_zgerfs (Nag_OrderType order, Nag_TransType trans, Integer n,
                 Integer nrhs, const Complex a[], Integer pda, const Complex af[],
                 Integer pdaf, const Integer ipiv[], const Complex b[], Integer pdb,
                 Complex x[], Integer pdx, double ferr[], double berr[], NagError *fail)
```

3 Description

nag_zgerfs (f07avc) returns the backward errors and estimated bounds on the forward errors for the solution of a complex system of linear equations with multiple right-hand sides \(AX = B\), \(A^TX = B\) or \(A^HX = B\). The function handles each right-hand side vector (stored as a column of the matrix \(B\)) independently, so we describe the function of nag_zgerfs (f07avc) in terms of a single right-hand side \(b\) and solution \(x\).

Given a computed solution \(x\), the function computes the \textit{component-wise backward error} \(\beta\). This is the size of the smallest relative perturbation in each element of \(A\) and \(b\) such that \(x\) is the exact solution of a perturbed system

\[
(A + \delta A)x = b + \delta b,
\]

with

\[
|\delta a_{ij}| \leq \beta |a_{ij}| \quad \text{and} \quad |\delta b_i| \leq \beta |b_i|.
\]

Then the function estimates a bound for the \textit{component-wise forward error} in the computed solution, defined by:

\[
\max_i |x_i - \hat{x}_i| / \max_i |x_i|
\]

where \(\hat{x}\) is the true solution.

For details of the method, see the f07 Chapter Introduction.

4 References

5 Arguments

1: \textbf{order} – Nag_OrderType \hspace{1cm} \textit{Input}

\textit{On entry}: the \textbf{order} argument specifies the two-dimensional storage scheme being used, i.e., row-major ordering or column-major ordering. C language defined storage is specified by \textbf{order} = Nag_RowMajor. See Section 3.2.1.3 in the Essential Introduction for a more detailed explanation of the use of this argument.

\textit{Constraint}: \textbf{order} = Nag_RowMajor or Nag_ColMajor.
2: \textbf{trans} – Nag_TransType \hspace{1cm} \textit{Input}

On entry: indicates the form of the linear equations for which \(X\) is the computed solution as follows:

\textbf{trans} = Nag_NoTrans
The linear equations are of the form \(AX = B\).

\textbf{trans} = Nag_Trans
The linear equations are of the form \(A^T X = B\).

\textbf{trans} = Nag_ConjTrans
The linear equations are of the form \(A^H X = B\).

Constraint: \textbf{trans} = Nag_NoTrans, Nag_Trans or Nag_ConjTrans.

3: \textbf{n} – Integer \hspace{1cm} \textit{Input}

On entry: \(n\), the order of the matrix \(A\).

Constraint: \(n \geq 0\).

4: \textbf{nrhs} – Integer \hspace{1cm} \textit{Input}

On entry: \(r\), the number of right-hand sides.

Constraint: \(nrhs \geq 0\).

5: \textbf{a} \hspace{1cm} \textit{const Complex} \hspace{1cm} \textit{Input}

\textbf{Note:} the dimension, \(dim\), of the array \textbf{a} must be at least \(\max(1, pda \times n)\).

The \((i, j)\)th element of the matrix \(A\) is stored in

\[a[(j - 1) \times pda + i - 1]\] when \textbf{order} = Nag_ColMajor;

\[a[(i - 1) \times pda + j - 1]\] when \textbf{order} = Nag_RowMajor.

On entry: the \(n\) by \(n\) original matrix \(A\) as supplied to \texttt{nag_zgetrf} (f07arc).

6: \textbf{pda} – Integer \hspace{1cm} \textit{Input}

On entry: the stride separating row or column elements (depending on the value of \textbf{order}) in the array \textbf{a}.

Constraint: \(pda \geq \max(1, n)\).

7: \textbf{af} \hspace{1cm} \textit{const Complex} \hspace{1cm} \textit{Input}

\textbf{Note:} the dimension, \(dim\), of the array \textbf{af} must be at least \(\max(1, pdaf \times n)\).

The \((i, j)\)th element of the matrix is stored in

\[af[(j - 1) \times pdaf + i - 1]\] when \textbf{order} = Nag_ColMajor;

\[af[(i - 1) \times pdaf + j - 1]\] when \textbf{order} = Nag_RowMajor.

On entry: the \(LU\) factorization of \(A\), as returned by \texttt{nag_zgetrf} (f07arc).

8: \textbf{pdaf} – Integer \hspace{1cm} \textit{Input}

On entry: the stride separating row or column elements (depending on the value of \textbf{order}) in the array \textbf{af}.

Constraint: \(pdaf \geq \max(1, n)\).

9: \textbf{ipiv} \hspace{1cm} \textit{const Integer} \hspace{1cm} \textit{Input}

\textbf{Note:} the dimension, \(dim\), of the array \textbf{ipiv} must be at least \(\max(1, n)\).

On entry: the pivot indices, as returned by \texttt{nag_zgetrf} (f07arc).
10: \(b[\text{dim}]\) – const Complex

**Note:** the dimension, \(\text{dim}\), of the array \(b\) must be at least
\[
\max(1, \text{pdb} \times \text{nrhs}) \text{ when } \text{order} = \text{Nag\_ColMajor};
\]
\[
\max(1, \text{n} \times \text{pdb}) \text{ when } \text{order} = \text{Nag\_RowMajor}.
\]

The \((i,j)\)th element of the matrix \(B\) is stored in
\[
b[j-1] \times \text{pdb} + i - 1] \text{ when } \text{order} = \text{Nag\_ColMajor};
\]
\[
b[i-1] \times \text{pdb} + j - 1] \text{ when } \text{order} = \text{Nag\_RowMajor}.
\]

**On entry:** the \(n\) by \(r\) right-hand side matrix \(B\).

11: \(\text{pdb}\) – Integer

**Input**

**On entry:** the stride separating row or column elements (depending on the value of \(\text{order}\)) in the array \(b\).

**Constraints:**
\[
\text{if } \text{order} = \text{Nag\_ColMajor}, \text{ pdb} \geq \max(1, \text{n});
\]
\[
\text{if } \text{order} = \text{Nag\_RowMajor}, \text{ pdb} \geq \max(1, \text{nrhs}).
\]

12: \(x[\text{dim}]\) – Complex

**Input/Output**

**Note:** the dimension, \(\text{dim}\), of the array \(x\) must be at least
\[
\max(1, \text{pdx} \times \text{nrhs}) \text{ when } \text{order} = \text{Nag\_ColMajor};
\]
\[
\max(1, \text{n} \times \text{pdx}) \text{ when } \text{order} = \text{Nag\_RowMajor}.
\]

The \((i,j)\)th element of the matrix \(X\) is stored in
\[
x[j-1] \times \text{pdx} + i - 1] \text{ when } \text{order} = \text{Nag\_ColMajor};
\]
\[
x[i-1] \times \text{pdx} + j - 1] \text{ when } \text{order} = \text{Nag\_RowMajor}.
\]

**On entry:** the \(n\) by \(r\) solution matrix \(X\), as returned by nag_zgetrs (f07asc).

**On exit:** the improved solution matrix \(X\).

13: \(\text{pdx}\) – Integer

**Input**

**On entry:** the stride separating row or column elements (depending on the value of \(\text{order}\)) in the array \(x\).

**Constraints:**
\[
\text{if } \text{order} = \text{Nag\_ColMajor}, \text{ pdx} \geq \max(1, \text{n});
\]
\[
\text{if } \text{order} = \text{Nag\_RowMajor}, \text{ pdx} \geq \max(1, \text{nrhs}).
\]

14: \(\text{ferr}[\text{nrhs}]\) – double

**Output**

**On exit:** \(\text{ferr}[j-1]\) contains an estimated error bound for the \(j\)th solution vector, that is, the \(j\)th column of \(X\), for \(j = 1, 2, \ldots, r\).

15: \(\text{berr}[\text{nrhs}]\) – double

**Output**

**On exit:** \(\text{berr}[j-1]\) contains the component-wise backward error bound \(\beta\) for the \(j\)th solution vector, that is, the \(j\)th column of \(X\), for \(j = 1, 2, \ldots, r\).

16: \(\text{fail}\) – NagError *

**Input/Output**

The NAG error argument (see Section 3.6 in the Essential Introduction).
6 Error Indicators and Warnings

**NE_ALLOC_FAIL**
Dynamic memory allocation failed.
See Section 3.2.1.2 in the Essential Introduction for further information.

**NE_BAD_PARAM**
On entry, argument \langle value \rangle had an illegal value.

**NE_INT**
On entry, \( n = \langle value \rangle \).
Constraint: \( n \geq 0 \).
On entry, \( \text{nrhs} = \langle value \rangle \).
Constraint: \( \text{nrhs} \geq 0 \).
On entry, \( \text{pda} = \langle value \rangle \).
Constraint: \( \text{pda} > 0 \).
On entry, \( \text{pdaf} = \langle value \rangle \).
Constraint: \( \text{pdaf} > 0 \).
On entry, \( \text{pdb} = \langle value \rangle \).
Constraint: \( \text{pdb} > 0 \).
On entry, \( \text{pdx} = \langle value \rangle \).
Constraint: \( \text{pdx} > 0 \).

**NE_INT_2**
On entry, \( \text{pda} = \langle value \rangle \) and \( n = \langle value \rangle \).
Constraint: \( \text{pda} \geq \max(1, n) \).
On entry, \( \text{pdaf} = \langle value \rangle \) and \( n = \langle value \rangle \).
Constraint: \( \text{pdaf} \geq \max(1, n) \).
On entry, \( \text{pdb} = \langle value \rangle \) and \( n = \langle value \rangle \).
Constraint: \( \text{pdb} \geq \max(1, n) \).
On entry, \( \text{pdb} = \langle value \rangle \) and \( \text{nrhs} = \langle value \rangle \).
Constraint: \( \text{pdb} \geq \max(1, \text{nrhs}) \).
On entry, \( \text{pdx} = \langle value \rangle \) and \( n = \langle value \rangle \).
Constraint: \( \text{pdx} \geq \max(1, n) \).
On entry, \( \text{pdx} = \langle value \rangle \) and \( \text{nrhs} = \langle value \rangle \).
Constraint: \( \text{pdx} \geq \max(1, \text{nrhs}) \).

**NE_INTERNAL_ERROR**
An internal error has occurred in this function. Check the function call and any array sizes. If the call is correct then please contact NAG for assistance.
An unexpected error has been triggered by this function. Please contact NAG.
See Section 3.6.6 in the Essential Introduction for further information.

**NE_NO_LICENCE**
Your licence key may have expired or may not have been installed correctly.
See Section 3.6.5 in the Essential Introduction for further information.
7 Accuracy

The bounds returned in ferr are not rigorous, because they are estimated, not computed exactly; but in practice they almost always overestimate the actual error.

8 Parallelism and Performance

nag_zgerfs (f07avc) is threaded by NAG for parallel execution in multithreaded implementations of the NAG Library.

nag_zgerfs (f07avc) makes calls to BLAS and/or LAPACK routines, which may be threaded within the vendor library used by this implementation. Consult the documentation for the vendor library for further information.

Please consult the X06 Chapter Introduction for information on how to control and interrogate the OpenMP environment used within this function. Please also consult the Users’ Note for your implementation for any additional implementation-specific information.

9 Further Comments

For each right-hand side, computation of the backward error involves a minimum of $16n^2$ real floating-point operations. Each step of iterative refinement involves an additional $24n^2$ real operations. At most five steps of iterative refinement are performed, but usually only one or two steps are required.

Estimating the forward error involves solving a number of systems of linear equations of the form $Ax = b$ or $A^H x = b$; the number is usually 5 and never more than 11. Each solution involves approximately $8n^2$ real operations.

The real analogue of this function is nag_dgerfs (f07ahc).

10 Example

This example solves the system of equations $AX = B$ using iterative refinement and to compute the forward and backward error bounds, where

$$A = \begin{pmatrix} -1.34 + 2.55i & 0.28 + 3.17i & -6.39 - 2.20i & 0.72 - 0.92i \\ -0.17 - 1.41i & 3.31 - 0.15i & -0.15 + 1.34i & 1.29 + 1.38i \\ -3.92 - 2.39i & -1.91 + 4.42i & -0.14 - 1.35i & 1.72 + 1.35i \\ 2.41 + 0.39i & -0.56 + 1.47i & -0.83 - 0.69i & -1.96 + 0.67i \end{pmatrix}$$

and

$$B = \begin{pmatrix} 26.26 + 51.78i & 31.32 - 6.70i \\ 6.43 - 8.68i & 15.86 - 1.42i \\ -5.75 + 25.31i & -2.15 + 30.19i \\ 1.16 + 2.57i & -2.56 + 7.55i \end{pmatrix}.$$  

Here $A$ is nonsymmetric and must first be factorized by nag_zgetrf (f07arc).
