1 Purpose

nag_dpoequ (f07ffc) computes a diagonal scaling matrix $S$ intended to equilibrate a real $n$ by $n$ symmetric positive definite matrix $A$ and reduce its condition number.

2 Specification

```c
#include <nag.h>
#include <nagf07.h>
void nag_dpoequ (Nag_OrderType order, Integer n, const double a[],
              Integer pda, double s[], double *scond, double *amax, NagError *fail)
```

3 Description

nag_dpoequ (f07ffc) computes a diagonal scaling matrix $S$ chosen so that

$$s_j = 1/\sqrt{a_{jj}}.$$  

This means that the matrix $B$ given by

$$B = SAS,$$

has diagonal elements equal to unity. This in turn means that the condition number of $B$, $\kappa_2(B)$, is within a factor $n$ of the matrix of smallest possible condition number over all possible choices of diagonal scalings (see Corollary 7.6 of Higham (2002)).

4 References

5 Arguments

1:  **order**  – Nag_OrderType  
    *Input*  
    
    On entry: the `order` argument specifies the two-dimensional storage scheme being used, i.e., row-major ordering or column-major ordering. C language defined storage is specified by `order = Nag_RowMajor`. See Section 3.2.1.3 in the Essential Introduction for a more detailed explanation of the use of this argument.  
    
    Constraint: `order = Nag_RowMajor` or `Nag_ColMajor`.

2:  **n**  – Integer  
    *Input*  
    
    On entry: $n$, the order of the matrix $A$.  
    
    Constraint: $n \geq 0$.

3:  **a[dim]**  – const double  
    *Input*  
    
    Note: the dimension, `dim`, of the array `a` must be at least $\max(1, \text{pda} \times n)$.  
    
    The $(i,j)$th element of the matrix $A$ is stored in
    
    $a[(j - 1) \times \text{pda} + i - 1]$ when `order = Nag_ColMajor`;  
    
    $a[(i - 1) \times \text{pda} + j - 1]$ when `order = Nag_RowMajor`.  

Mark 25
On entry: the matrix $A$ whose scaling factors are to be computed. Only the diagonal elements of the array $a$ are referenced.

4: $pda$ – Integer

On entry: the stride separating row or column elements (depending on the value of order) in the array $a$.

Constraint: $pda \geq \max(1, n)$.

5: $s[n]$ – double

On exit: if fail.code = NE_NOERROR, $s$ contains the diagonal elements of the scaling matrix $S$.

6: $scond$ – double *

On exit: if fail.code = NE_NOERROR, $scond$ contains the ratio of the smallest value of $s$ to the largest value of $s$. If $scond \geq 0.1$ and $amax$ is neither too large nor too small, it is not worth scaling by $S$.

7: $amax$ – double *

On exit: $\max |a_{ij}|$. If $amax$ is very close to overflow or underflow, the matrix $A$ should be scaled.

8: $fail$ – NagError *

The NAG error argument (see Section 3.6 in the Essential Introduction).

6 Error Indicators and Warnings

NE_ALLOC_FAIL

Dynamic memory allocation failed.
See Section 3.2.1.2 in the Essential Introduction for further information.

NE_BAD_PARAM

On entry, argument \langle value\rangle had an illegal value.

NE_INT

On entry, $n = \langle value\rangle$.
Constraint: $n \geq 0$.

On entry, $pda = \langle value\rangle$.
Constraint: $pda > 0$.

NE_INT_2

On entry, $pda = \langle value\rangle$ and $n = \langle value\rangle$.
Constraint: $pda \geq \max(1, n)$.

NE_INTERNAL_ERROR

An internal error has occurred in this function. Check the function call and any array sizes. If the call is correct then please contact NAG for assistance.
An unexpected error has been triggered by this function. Please contact NAG.
See Section 3.6.6 in the Essential Introduction for further information.

NE_MAT_NOT_POS_DEF

The \langle value\rangle\text{th} diagonal element of $A$ is not positive (and hence $A$ cannot be positive definite).
7 Accuracy
The computed scale factors will be close to the exact scale factors.

8 Parallelism and Performance
Not applicable.

9 Further Comments
The complex analogue of this function is nag_zpoequ (f07ftc).

10 Example
This example equilibrates the symmetric positive definite matrix $A$ given by

$$
A = \begin{pmatrix}
4.16 & -3.12 \times 10^5 & 0.56 & -0.10 \\
-3.12 \times 10^5 & 5.03 \times 10^{10} & -0.83 \times 10^5 & 1.18 \times 10^5 \\
0.56 & -0.83 \times 10^5 & 0.76 & 0.34 \\
-0.10 & 1.18 \times 10^5 & 0.34 & 1.18
\end{pmatrix}.
$$

Details of the scaling factors and the scaled matrix are output.
