NAG Library Function Document
nag_zpotri (f07fwc)

1 Purpose
nag_zpotri (f07fwc) computes the inverse of a complex Hermitian positive definite matrix \( A \), where \( A \) has been factorized by nag_zpotrf (f07frc).

2 Specification

```c
#include <nag.h>
#include <nagf07.h>
void nag_zpotri (Nag_OrderType order, Nag_UploType uplo, Integer n,
                  Complex a[], Integer pda, NagError *fail)
```

3 Description
nag_zpotri (f07fwc) is used to compute the inverse of a complex Hermitian positive definite matrix \( A \), the function must be preceded by a call to nag_zpotrf (f07frc), which computes the Cholesky factorization of \( A \).

If \( \text{uplo} = \text{Nag}_\text{Upper} \), \( A = U^H U \) and \( A^{-1} \) is computed by first inverting \( U \) and then forming \((U^{-1})U^{-H}\).

If \( \text{uplo} = \text{Nag}_\text{Lower} \), \( A = LL^H \) and \( A^{-1} \) is computed by first inverting \( L \) and then forming \( L^{-H}(L^{-1}) \).

4 References

5 Arguments
1: \texttt{order} – Nag_OrderType 
   \textit{Input}
   \textit{On entry:} the \texttt{order} argument specifies the two-dimensional storage scheme being used, i.e., row-major ordering or column-major ordering. C language defined storage is specified by \texttt{order} = Nag_RowMajor. See Section 3.2.1.3 in the Essential Introduction for a more detailed explanation of the use of this argument.
   \textit{Constraint:} \texttt{order} = Nag_RowMajor or Nag_ColMajor.

2: \texttt{uplo} – Nag_UploType 
   \textit{Input}
   \textit{On entry:} specifies how \( A \) has been factorized.
   \texttt{uplo} = Nag_Upper
   \( A = U^H U \), where \( U \) is upper triangular.
   \texttt{uplo} = Nag_Lower
   \( A = LL^H \), where \( L \) is lower triangular.
   \textit{Constraint:} \texttt{uplo} = Nag_Upper or Nag_Lower.

3: \texttt{n} – Integer 
   \textit{Input}
   \textit{On entry:} \( n \), the order of the matrix \( A \).
   \textit{Constraint:} \( n \geq 0 \).
Note: the dimension, dim, of the array a must be at least max(1, pda × n).
On entry: the upper triangular matrix $U$ if uplo = Nag_Upper or the lower triangular matrix $L$ if uplo = Nag_Lower, as returned by nag_zpotrf (f07frc).
On exit: $U$ is overwritten by the upper triangle of $A^{-1}$ if uplo = Nag_Upper; $L$ is overwritten by the lower triangle of $A^{-1}$ if uplo = Nag_Lower.

On entry: the stride separating row or column elements (depending on the value of order) of the matrix in the array a.
Constraint: pda ≥ max(1, n).

The NAG error argument (see Section 3.6 in the Essential Introduction).

6 Error Indicators and Warnings

NE_ALLOC_FAIL
Dynamic memory allocation failed.
See Section 3.2.1.2 in the Essential Introduction for further information.

NE_BAD_PARAM
On entry, argument ⟨value⟩ had an illegal value.

NE_INT
On entry, n = ⟨value⟩.
Constraint: n ≥ 0.

On entry, pda = ⟨value⟩.
Constraint: pda > 0.

NE_INT_2
On entry, pda = ⟨value⟩ and n = ⟨value⟩.
Constraint: pda ≥ max(1, n).

NE_INTERNAL_ERROR
An internal error has occurred in this function. Check the function call and any array sizes. If the call is correct then please contact NAG for assistance.
An unexpected error has been triggered by this function. Please contact NAG.
See Section 3.6.6 in the Essential Introduction for further information.

NE_NO_LICENCE
Your licence key may have expired or may not have been installed correctly.
See Section 3.6.5 in the Essential Introduction for further information.

NE_SINGULAR
Diagonal element ⟨value⟩ of the Cholesky factor is zero; the Cholesky factor is singular and the inverse of $A$ cannot be computed.
7 Accuracy
The computed inverse $X$ satisfies

$$
\|XA - I\|_2 \leq c(n)\epsilon \kappa_2(A) \quad \text{and} \quad \|AX - I\|_2 \leq c(n)\epsilon \kappa_2(A),
$$

where $c(n)$ is a modest function of $n$, $\epsilon$ is the machine precision and $\kappa_2(A)$ is the condition number of $A$ defined by

$$
\kappa_2(A) = \|A\|_2\|A^{-1}\|_2.
$$

8 Parallelism and Performance

`nag_zpotri (f07fwc)` is not threaded by NAG in any implementation.

`nag_zpotri (f07fwc)` makes calls to BLAS and/or LAPACK routines, which may be threaded within the vendor library used by this implementation. Consult the documentation for the vendor library for further information.

Please consult the X06 Chapter Introduction for information on how to control and interrogate the OpenMP environment used within this function. Please also consult the Users’ Note for your implementation for any additional implementation-specific information.

9 Further Comments

The total number of real floating-point operations is approximately $\frac{8}{3}n^3$.

The real analogue of this function is `nag_dpotri (f07fjc).

10 Example

This example computes the inverse of the matrix $A$, where

$$
A = \begin{pmatrix}
3.23 + 0.00i & 1.51 - 1.92i & 1.90 + 0.84i & 0.42 + 2.50i \\
1.51 + 1.92i & 3.58 + 0.00i & -0.23 + 1.11i & -1.18 + 1.37i \\
1.90 - 0.84i & -0.23 - 1.11i & 4.09 + 0.00i & 2.33 - 0.14i \\
0.42 - 2.50i & -1.18 - 1.37i & 2.33 + 0.14i & 4.29 + 0.00i
\end{pmatrix}.
$$

Here $A$ is Hermitian positive definite and must first be factorized by `nag_zpotrf (f07frc).
