nag_dpbrfs (f07hlc) returns error bounds for the solution of a real symmetric positive definite band system of linear equations with multiple right-hand sides, $AX = B$. It improves the solution by iterative refinement, in order to reduce the backward error as much as possible.

2 Specification

#include <nag.h>
#include <nagf07.h>

void nag_dpbrfs (Nag_OrderType order, Nag_UploType uplo, Integer n,
                Integer kd, Integer nrhs, const double ab[], Integer pdab,
                const double afb[], Integer pdafb, const double b[], Integer pdb,
                double x[], Integer pdx, double ferr[], double berr[], NagError *fail)

3 Description

nag_dpbrfs (f07hlc) returns the backward errors and estimated bounds on the forward errors for the solution of a real symmetric positive definite band system of linear equations with multiple right-hand sides $AX = B$. The function handles each right-hand side vector (stored as a column of the matrix $B$) independently, so we describe the function of nag_dpbrfs (f07hlc) in terms of a single right-hand side $b$ and solution $x$.

Given a computed solution $x$, the function computes the component-wise backward error $\beta$. This is the size of the smallest relative perturbation in each element of $A$ and $b$ such that $x$ is the exact solution of a perturbed system

$$(A + \delta A)x = b + \delta b$$

$$|\delta a_{ij}| \leq \beta |a_{ij}| \quad \text{and} \quad |\delta b_i| \leq \beta |b_i|.$$ 

Then the function estimates a bound for the component-wise forward error in the computed solution, defined by:

$$\max_i |x_i - \hat{x}_i| / \max_i |x_i|$$

where $\hat{x}$ is the true solution.

For details of the method, see the f07 Chapter Introduction.

4 References

5 Arguments

1:  order  – Nag_OrderType

   On entry: the order argument specifies the two-dimensional storage scheme being used, i.e., row-major ordering or column-major ordering. C language defined storage is specified by order = Nag_RowMajor. See Section 3.2.1.3 in the Essential Introduction for a more detailed explanation of the use of this argument.

   Constraint: order = Nag_RowMajor or Nag_ColMajor.
2:  \textbf{uplo} – Nag_UploType  
   \textit{Input}
   
   \textit{On entry}: specifies whether the upper or lower triangular part of \( A \) is stored and how \( A \) is to be factorized.
   
   \textbf{uplo} = Nag_Upper
   
   The upper triangular part of \( A \) is stored and \( A \) is factorized as \( U^T U \), where \( U \) is upper triangular.
   
   \textbf{uplo} = Nag_Lower
   
   The lower triangular part of \( A \) is stored and \( A \) is factorized as \( LL^T \), where \( L \) is lower triangular.
   
   \textit{Constraint}: \textbf{uplo} = Nag_Upper or Nag_Lower.

3:  \textbf{n} – Integer  
   \textit{Input}
   
   \textit{On entry}: \( n \), the order of the matrix \( A \).
   
   \textit{Constraint}: \( n \geq 0 \).

4:  \textbf{kd} – Integer  
   \textit{Input}
   
   \textit{On entry}: \( k_d \), the number of superdiagonals or subdiagonals of the matrix \( A \).
   
   \textit{Constraint}: \( k_d \geq 0 \).

5:  \textbf{nrhs} – Integer  
   \textit{Input}
   
   \textit{On entry}: \( r \), the number of right-hand sides.
   
   \textit{Constraint}: \( \textbf{nrhs} \geq 0 \).

6:  \textbf{ab}[\textit{dim}] – const double  
   \textit{Input}
   
   \textit{Note}: the dimension, \( \textit{dim} \), of the array \textbf{ab} must be at least \( \max(1, \textbf{pdab} \times \textbf{n}) \).
   
   \textit{On entry}: the \( n \) by \( n \) original symmetric positive definite band matrix \( A \) as supplied to \texttt{nag_dpbtrf} (f07hdc).

7:  \textbf{pdab} – Integer  
   \textit{Input}
   
   \textit{On entry}: the stride separating row or column elements (depending on the value of \texttt{order}) of the matrix in the array \textbf{ab}.
   
   \textit{Constraint}: \( \textbf{pdab} \geq \textbf{kd} + 1 \).

8:  \textbf{afb}[\textit{dim}] – const double  
   \textit{Input}
   
   \textit{Note}: the dimension, \( \textit{dim} \), of the array \textbf{afb} must be at least \( \max(1, \textbf{pdafb} \times \textbf{n}) \).
   
   \textit{On entry}: the Cholesky factor of \( A \), as returned by \texttt{nag_dpbtrf} (f07hdc).

9:  \textbf{pdafb} – Integer  
   \textit{Input}
   
   \textit{On entry}: the stride separating row or column elements (depending on the value of \texttt{order}) of the matrix in the array \textbf{afb}.
   
   \textit{Constraint}: \( \textbf{pdafb} \geq \textbf{kd} + 1 \).

10: \textbf{b}[\textit{dim}] – const double  
    \textit{Input}
    
    \textit{Note}: the dimension, \( \textit{dim} \), of the array \textbf{b} must be at least
    \( \max(1, \textbf{pdb} \times \textbf{nrhs}) \) when \texttt{order} = Nag_ColMajor;
    \( \max(1, \textbf{n} \times \textbf{pdb}) \) when \texttt{order} = Nag_RowMajor.
The \((i, j)\)th element of the matrix \(B\) is stored in
\[ b[(j - 1) \times \text{pdb} + i - 1] \text{ when order = Nag\_ColMajor}; \]
\[ b[(i - 1) \times \text{pdb} + j - 1] \text{ when order = Nag\_RowMajor}. \]

On entry: the \(n\) by \(r\) right-hand side matrix \(B\).

11: \textbf{pdb} – Integer \hspace{1cm} \textit{Input}

On entry: the stride separating row or column elements (depending on the value of \texttt{order}) in the array \(b\).

Constraints:
- if \texttt{order} = Nag\_ColMajor, \texttt{pdb} \geq \max(1, n);
- if \texttt{order} = Nag\_RowMajor, \texttt{pdb} \geq \max(1, \text{nrhs}).

12: \textbf{x}[\text{dim}] – double \hspace{1cm} \textit{Input/Output}

Note: the dimension, \texttt{dim}, of the array \(x\) must be at least
\[ \max(1, \text{pdx} \times \text{nrhs}) \text{ when order = Nag\_ColMajor}; \]
\[ \max(1, n \times \text{pdx}) \text{ when order = Nag\_RowMajor}. \]

The \((i, j)\)th element of the matrix \(X\) is stored in
\[ x[(j - 1) \times \text{pdx} + i - 1] \text{ when order = Nag\_ColMajor}; \]
\[ x[(i - 1) \times \text{pdx} + j - 1] \text{ when order = Nag\_RowMajor}. \]

On entry: the \(n\) by \(r\) solution matrix \(X\), as returned by nag\_dpbtrs (f07hec).

On exit: the improved solution matrix \(X\).

13: \textbf{pdx} – Integer \hspace{1cm} \textit{Input}

On entry: the stride separating row or column elements (depending on the value of \texttt{order}) in the array \(x\).

Constraints:
- if \texttt{order} = Nag\_ColMajor, \texttt{pdx} \geq \max(1, n);
- if \texttt{order} = Nag\_RowMajor, \texttt{pdx} \geq \max(1, \text{nrhs}).

14: \textbf{ferr}[\text{nrhs}] – double \hspace{1cm} \textit{Output}

On exit: \texttt{ferr}[j - 1] contains an estimated error bound for the \(j\)th solution vector, that is, the \(j\)th column of \(X\), for \(j = 1, 2, \ldots, r\).

15: \textbf{berr}[\text{nrhs}] – double \hspace{1cm} \textit{Output}

On exit: \texttt{berr}[j - 1] contains the component-wise backward error bound \(\beta\) for the \(j\)th solution vector, that is, the \(j\)th column of \(X\), for \(j = 1, 2, \ldots, r\).

16: \textbf{fail} – NagError * \hspace{1cm} \textit{Input/Output}

The NAG error argument (see Section 3.6 in the Essential Introduction).

6 Error Indicators and Warnings

\textbf{NE\_ALLOC\_FAIL}

Dynamic memory allocation failed.

See Section 3.2.1.2 in the Essential Introduction for further information.

\textbf{NE\_BAD\_PARAM}

On entry, argument \textit{\langle value\rangle} had an illegal value.
NE_INT

On entry, \(kd = \langle \text{value}\rangle\).
Constraint: \(kd \geq 0\).

On entry, \(n = \langle \text{value}\rangle\).
Constraint: \(n \geq 0\).

On entry, \(nrhs = \langle \text{value}\rangle\).
Constraint: \(nrhs \geq 0\).

On entry, \(pdab = \langle \text{value}\rangle\).
Constraint: \(pdab > 0\).

On entry, \(pdafb = \langle \text{value}\rangle\).
Constraint: \(pdafb > 0\).

On entry, \(pdb = \langle \text{value}\rangle\).
Constraint: \(pdb > 0\).

On entry, \(pdx = \langle \text{value}\rangle\).
Constraint: \(pdx > 0\).

NE_INT_2

On entry, \(pdab = \langle \text{value}\rangle\) and \(kd = \langle \text{value}\rangle\).
Constraint: \(pdab \geq kd + 1\).

On entry, \(pdafb = \langle \text{value}\rangle\) and \(kd = \langle \text{value}\rangle\).
Constraint: \(pdafb \geq kd + 1\).

On entry, \(pdb = \langle \text{value}\rangle\) and \(n = \langle \text{value}\rangle\).
Constraint: \(pdb \geq \max(1, n)\).

On entry, \(pdb = \langle \text{value}\rangle\) and \(nrhs = \langle \text{value}\rangle\).
Constraint: \(pdb \geq \max(1, nrhs)\).

On entry, \(pdx = \langle \text{value}\rangle\) and \(n = \langle \text{value}\rangle\).
Constraint: \(pdx \geq \max(1, n)\).

On entry, \(pdx = \langle \text{value}\rangle\) and \(nrhs = \langle \text{value}\rangle\).
Constraint: \(pdx \geq \max(1, nrhs)\).

NE_INTERNAL_ERROR

An internal error has occurred in this function. Check the function call and any array sizes. If the call is correct then please contact NAG for assistance.

An unexpected error has been triggered by this function. Please contact NAG.
See Section 3.6.6 in the Essential Introduction for further information.

NE_NO_LICENCE

Your licence key may have expired or may not have been installed correctly.
See Section 3.6.5 in the Essential Introduction for further information.

7 Accuracy

The bounds returned in \(\text{ferr}\) are not rigorous, because they are estimated, not computed exactly; but in practice they almost always overestimate the actual error.

8 Parallelism and Performance

\text{nag_dpbrfs (f07hcx)} is threaded by NAG for parallel execution in multithreaded implementations of the NAG Library.
nag_dpbrfs (f07hjc) makes calls to BLAS and/or LAPACK routines, which may be threaded within the vendor library used by this implementation. Consult the documentation for the vendor library for further information.

Please consult the X06 Chapter Introduction for information on how to control and interrogate the OpenMP environment used within this function. Please also consult the Users’ Note for your implementation for any additional implementation-specific information.

9 Further Comments

For each right-hand side, computation of the backward error involves a minimum of $8nk$ floating-point operations. Each step of iterative refinement involves an additional $12nk$ operations. This assumes $n \gg k$. At most five steps of iterative refinement are performed, but usually only one or two steps are required.

Estimating the forward error involves solving a number of systems of linear equations of the form $Ax = b$; the number is usually 4 or 5 and never more than 11. Each solution involves approximately $4nk$ operations.

The complex analogue of this function is nag_zpbrfs (f07hvc).

10 Example

This example solves the system of equations $AX = B$ using iterative refinement and to compute the forward and backward error bounds, where

$$A = \begin{pmatrix} 5.49 & 2.68 & 0.00 & 0.00 \\ 2.68 & 5.63 & -2.39 & 0.00 \\ 0.00 & -2.39 & 2.60 & -2.22 \\ 0.00 & 0.00 & -2.22 & 5.17 \end{pmatrix} \quad \text{and} \quad B = \begin{pmatrix} 22.09 & 5.10 \\ 9.31 & 30.81 \\ -5.24 & -25.82 \\ 11.83 & 22.90 \end{pmatrix}.$$ 

Here $A$ is symmetric and positive definite, and is treated as a band matrix, which must first be factorized by nag_dpbtrf (f07hdc).
