NAG Library Function Document

nag_dsytrs (f07mec)

1 Purpose
nag_dsytrs (f07mec) solves a real symmetric indefinite system of linear equations with multiple right-hand sides,

\[ AX = B, \]

where \( A \) has been factorized by nag_dsytrf (f07mdc).

2 Specification

```c
#include <nag.h>
#include <nagf07.h>
void nag_dsytrs (Nag_OrderType order, Nag_UploType uplo, Integer n, 
                 Integer nrhs, const double a[], Integer pda, const Integer ipiv[], 
                 double b[], Integer pdb, NagError *fail)
```

3 Description
nag_dsytrs (f07mec) is used to solve a real symmetric indefinite system of linear equations \( AX = B \), this function must be preceded by a call to nag_dsytrf (f07mdc) which computes the Bunch–Kaufman factorization of \( A \).

If \( \text{uplo} = \text{Nag\_Upper} \), \( A = PUDU^T P^T \), where \( P \) is a permutation matrix, \( U \) is an upper triangular matrix and \( D \) is a symmetric block diagonal matrix with 1 by 1 and 2 by 2 blocks; the solution \( X \) is computed by solving \( PUDY = B \) and then \( U^TP^TX = Y \).

If \( \text{uplo} = \text{Nag\_Lower} \), \( A = PLDL^T P^T \), where \( L \) is a lower triangular matrix; the solution \( X \) is computed by solving \( PLDY = B \) and then \( L^TP^TX = Y \).

4 References

5 Arguments

1:  order – Nag_OrderType

   On entry: the order argument specifies the two-dimensional storage scheme being used, i.e., row-major ordering or column-major ordering. C language defined storage is specified by order = Nag_RowMajor. See Section 3.2.1.3 in the Essential Introduction for a more detailed explanation of the use of this argument.

   Constraint: order = Nag_RowMajor or Nag_ColMajor.

2:  uplo – Nag_UploType

   On entry: specifies how \( A \) has been factorized.

   uplo = Nag_Upper
       \( A = PUDU^T P^T \), where \( U \) is upper triangular.
\textbf{f07mec}\hspace{1cm} \textit{NAG Library Manual}

\texttt{\texttt{uplo = Nag\_Lower}}

\[ A = PLDL^T, \text{ where } L \text{ is lower triangular.} \]

\textit{Constraint:} \texttt{uplo} = Nag\_Upper or Nag\_Lower.

3: \hspace{1cm} \texttt{n} \hspace{0.5cm} \text{Integer} \hspace{1cm} \textit{Input}

\textit{On entry:} \texttt{n}, the order of the matrix \texttt{A}.

\textit{Constraint:} \texttt{n} \geq 0.

4: \hspace{1cm} \texttt{nrhs} \hspace{0.5cm} \text{Integer} \hspace{1cm} \textit{Input}

\textit{On entry:} \texttt{r}, the number of right-hand sides.

\textit{Constraint:} \texttt{nrhs} \geq 0.

5: \hspace{1cm} \texttt{a[\texttt{dim}]} \hspace{0.5cm} \text{const double} \hspace{1cm} \textit{Input}

\textit{Note:} the dimension, \texttt{dim}, of the array \texttt{a} must be at least \texttt{max(1, pda \times n)}.

\textit{On entry:} details of the factorization of \texttt{A}, as returned by nag_dsytrf (f07mdc).

6: \hspace{1cm} \texttt{pda} \hspace{0.5cm} \text{Integer} \hspace{1cm} \textit{Input}

\textit{On entry:} the stride separating row or column elements (depending on the value of \texttt{order}) of the matrix in the array \texttt{a}.

\textit{Constraint:} \texttt{pda} \geq \texttt{max(1, n)}.

7: \hspace{1cm} \texttt{ipiv[\texttt{dim}]} \hspace{0.5cm} \text{const Integer} \hspace{1cm} \textit{Input}

\textit{Note:} the dimension, \texttt{dim}, of the array \texttt{ipiv} must be at least \texttt{max(1, n)}.

\textit{On entry:} details of the interchanges and the block structure of \texttt{D}, as returned by nag_dsytrf (f07mdc).

8: \hspace{1cm} \texttt{b[\texttt{dim}]} \hspace{0.5cm} \text{double} \hspace{1cm} \textit{Input/Output}

\textit{Note:} the dimension, \texttt{dim}, of the array \texttt{b} must be at least

\[ \texttt{max(1, pdb \times nrhs)} \] when \texttt{order} = Nag\_ColMajor;

\[ \texttt{max(1, n \times pdb)} \] when \texttt{order} = Nag\_RowMajor.

The \((i, j)\)th element of the matrix \texttt{B} is stored in

\[ \texttt{b[(j - 1) \times pdb + i - 1]} \] when \texttt{order} = Nag\_ColMajor;

\[ \texttt{b[(i - 1) \times pdb + j - 1]} \] when \texttt{order} = Nag\_RowMajor.

\textit{On entry:} the \texttt{n} by \texttt{r} right-hand side matrix \texttt{B}.

\textit{On exit:} the \texttt{n} by \texttt{r} solution matrix \texttt{X}.

9: \hspace{1cm} \texttt{pdb} \hspace{0.5cm} \text{Integer} \hspace{1cm} \textit{Input}

\textit{On entry:} the stride separating row or column elements (depending on the value of \texttt{order}) in the array \texttt{b}.

\textit{Constraints:}

\[ \text{if } \texttt{order} = \text{Nag\_ColMajor}, \texttt{pdb} \geq \text{max(1, n)}; \]

\[ \text{if } \texttt{order} = \text{Nag\_RowMajor}, \texttt{pdb} \geq \text{max(1, nrhs)}. \]

10: \hspace{1cm} \texttt{fail} \hspace{0.5cm} \text{NagError *} \hspace{1cm} \textit{Input/Output}

The NAG error argument (see Section 3.6 in the Essential Introduction).
6 Error Indicators and Warnings

NE_ALLOC_FAIL
Dynamic memory allocation failed.
See Section 3.2.1.2 in the Essential Introduction for further information.

NE_BAD_PARAM
On entry, argument \textlangle value\rangle had an illegal value.

NE_INT
On entry, \(n = \langle value\rangle\).
Constraint: \(n \geq 0\).
On entry, \(\text{nrhs} = \langle value\rangle\).
Constraint: \(\text{nrhs} \geq 0\).
On entry, \(\text{pda} = \langle value\rangle\).
Constraint: \(\text{pda} > 0\).
On entry, \(\text{pdb} = \langle value\rangle\).
Constraint: \(\text{pdb} > 0\).

NE_INT_2
On entry, \(\text{pda} = \langle value\rangle\) and \(n = \langle value\rangle\).
Constraint: \(\text{pda} \geq \max(1, n)\).
On entry, \(\text{pdb} = \langle value\rangle\) and \(n = \langle value\rangle\).
Constraint: \(\text{pdb} \geq \max(1, n)\).
On entry, \(\text{pdb} = \langle value\rangle\) and \(\text{nrhs} = \langle value\rangle\).
Constraint: \(\text{pdb} \geq \max(1, \text{nrhs})\).

NE_INTERNAL_ERROR
An internal error has occurred in this function. Check the function call and any array sizes. If the call is correct then please contact NAG for assistance.
An unexpected error has been triggered by this function. Please contact NAG.
See Section 3.6.6 in the Essential Introduction for further information.

NE_NO_LICENCE
Your licence key may have expired or may not have been installed correctly.
See Section 3.6.5 in the Essential Introduction for further information.

7 Accuracy

For each right-hand side vector \(b\), the computed solution \(x\) is the exact solution of a perturbed system of equations \((A + E)x = b\), where

\[
\text{if } \text{uplo} = \text{Nag} \_\text{Upper}, \ |E| \leq c(n)\epsilon P|U||D||U^T|P^T; \\
\text{if } \text{uplo} = \text{Nag} \_\text{Lower}, \ |E| \leq c(n)\epsilon P|L||D||L^T|P^T,
\]

\(c(n)\) is a modest linear function of \(n\), and \(\epsilon\) is the \textit{machine precision}.

If \(\hat{x}\) is the true solution, then the computed solution \(x\) satisfies a forward error bound of the form

\[
\frac{\|x - \hat{x}\|_\infty}{\|x\|_\infty} \leq c(n) \text{cond}(A, x)\epsilon
\]

where \(\text{cond}(A, x) = \|A^{-1}\|A\|x\|_\infty/\|x\|_\infty \leq \text{cond}(A) = \|A^{-1}\|A\|_\infty \leq \kappa_\infty(A)\).
Note that \( \text{cond}(A, x) \) can be much smaller than \( \text{cond}(A) \).

Forward and backward error bounds can be computed by calling \text{nag_dsyrs} (f07mhc), and an estimate for \( \kappa_1(A) \) (\( = \kappa_2(A) \)) can be obtained by calling \text{nag_dsycon} (f07mgc).

8 Parallelism and Performance

\text{nag_dsytrs} (f07mec) is not threaded by NAG in any implementation.

\text{nag_dsytrs} (f07mec) makes calls to BLAS and/or LAPACK routines, which may be threaded within the vendor library used by this implementation. Consult the documentation for the vendor library for further information.

Please consult the X06 Chapter Introduction for information on how to control and interrogate the OpenMP environment used within this function. Please also consult the Users’ Note for your implementation for any additional implementation-specific information.

9 Further Comments

The total number of floating-point operations is approximately \( 2n^2r \).

This function may be followed by a call to \text{nag_dsyrs} (f07mhc) to refine the solution and return an error estimate.

The complex analogues of this function are \text{nag_zhetrs} (f07msc) for Hermitian matrices and \text{nag_zsytrs} (f07nsc) for symmetric matrices.

10 Example

This example solves the system of equations \( AX = B \), where

\[
A = \begin{pmatrix}
2.07 & 3.87 & 4.20 & -1.15 \\
3.87 & -0.21 & 1.87 & 0.63 \\
4.20 & 1.87 & 1.15 & 2.06 \\
-1.15 & 0.63 & 2.06 & -1.81 \\
\end{pmatrix}
\quad \text{and} \quad
B = \begin{pmatrix}
-9.50 & 27.85 \\
-8.38 & 9.90 \\
-6.07 & 19.25 \\
-0.96 & 3.93 \\
\end{pmatrix}.
\]

Here \( A \) is symmetric indefinite and must first be factorized by \text{nag_dsytrf} (f07mdc).
