1 Purpose

nag_zhptrf (f07prc) computes the Bunch–Kaufman factorization of a complex Hermitian indefinite matrix, using packed storage.

2 Specification

```c
#include <nag.h>
#include <nagf07.h>
void nag_zhptrf (Nag_OrderType order, Nag_UploType uplo, Integer n,
                 Complex ap[], Integer ipiv[], NagError *fail)
```

3 Description

nag_zhptrf (f07prc) factorizes a complex Hermitian matrix $A$, using the Bunch–Kaufman diagonal pivoting method and packed storage. $A$ is factorized as either $A = PUDU^HPT$ if `uplo` = Nag_Upper or $A = PLDL^HPT$ if `uplo` = Nag_Lower, where $P$ is a permutation matrix, $U$ (or $L$) is a unit upper (or lower) triangular matrix and $D$ is an Hermitian block diagonal matrix with 1 by 1 and 2 by 2 diagonal blocks; $U$ (or $L$) has 2 by 2 unit diagonal blocks corresponding to the 2 by 2 blocks of $D$. Row and column interchanges are performed to ensure numerical stability while keeping the matrix Hermitian.

This method is suitable for Hermitian matrices which are not known to be positive definite. If $A$ is in fact positive definite, no interchanges are performed and no 2 by 2 blocks occur in $D$.

4 References

5 Arguments

1: `order` – Nag_OrderType

*Input*

On entry: the `order` argument specifies the two-dimensional storage scheme being used, i.e., row-major ordering or column-major ordering. C language defined storage is specified by `order` = Nag_RowMajor. See Section 3.2.1.3 in the Essential Introduction for a more detailed explanation of the use of this argument.

Constraint: `order` = Nag_RowMajor or Nag_ColMajor.

2: `uplo` – Nag_UploType

*Input*

On entry: specifies whether the upper or lower triangular part of $A$ is stored and how $A$ is to be factorized.

`uplo` = Nag_Upper

The upper triangular part of $A$ is stored and $A$ is factorized as $PUDU^HTPT$, where $U$ is upper triangular.

`uplo` = Nag_Lower

The lower triangular part of $A$ is stored and $A$ is factorized as $PLDL^HTPT$, where $L$ is lower triangular.

Constraint: `uplo` = Nag_Upper or Nag_Lower.
3: \( n \) – Integer

*Input*

*On entry:* \( n \), the order of the matrix \( A \).

*Constraint:* \( n \geq 0 \).

4: \( \text{ap}[\text{dim}] \) – Complex

*Input/Output*

*Note:* the dimension, \( \text{dim} \), of the array \( \text{ap} \) must be at least \( \max(1, n \times (n + 1)/2) \).

*On entry:* the \( n \) by \( n \) Hermitian matrix \( A \), packed by rows or columns.

The storage of elements \( A_{ij} \) depends on the \( \text{order} \) and \( \text{uplo} \) arguments as follows:

- if \( \text{order} = \text{Nag}_{\text{ColMajor}} \) and \( \text{uplo} = \text{Nag}_{\text{Upper}} \), \( A_{ij} \) is stored in \( \text{ap}[(j - 1) \times j/2 + i - 1] \), for \( i \leq j \);
- if \( \text{order} = \text{Nag}_{\text{ColMajor}} \) and \( \text{uplo} = \text{Nag}_{\text{Lower}} \), \( A_{ij} \) is stored in \( \text{ap}[(2n - j) \times (j - 1)/2 + i - 1] \), for \( i \geq j \);
- if \( \text{order} = \text{Nag}_{\text{RowMajor}} \) and \( \text{uplo} = \text{Nag}_{\text{Upper}} \), \( A_{ij} \) is stored in \( \text{ap}[(2n - i) \times (i - 1)/2 + j - 1] \), for \( i \leq j \);
- if \( \text{order} = \text{Nag}_{\text{RowMajor}} \) and \( \text{uplo} = \text{Nag}_{\text{Lower}} \), \( A_{ij} \) is stored in \( \text{ap}[(i - 1) \times i/2 + j - 1] \), for \( i \geq j \).

*On exit:* \( A \) is overwritten by details of the block diagonal matrix \( D \) and the multipliers used to obtain the factor \( U \) or \( L \) as specified by \( \text{uplo} \).

5: \( \text{ipiv}[n] \) – Integer

*Output*

*On exit:* details of the interchanges and the block structure of \( D \). More precisely,

- if \( \text{ipiv}[i - 1] = k > 0 \), \( d_{ii} \) is a 1 by 1 pivot block and the \( i \)th row and column of \( A \) were interchanged with the \( k \)th row and column;

- if \( \text{uplo} = \text{Nag}_{\text{Upper}} \) and \( \text{ipiv}[i - 2] = \text{ipiv}[i - 1] = -l < 0 \), \( \begin{pmatrix} d_{l-1,i-1} & \tilde{d}_{i-1,j} \\ \tilde{d}_{i,j-1} & d_{ii} \end{pmatrix} \) is a 2 by 2 pivot block and the \( (i - 1) \)th row and column of \( A \) were interchanged with the \( l \)th row and column;

- if \( \text{uplo} = \text{Nag}_{\text{Lower}} \) and \( \text{ipiv}[i - 1] = \text{ipiv}[i] = -m < 0 \), \( \begin{pmatrix} d_{ii} & d_{i+1,i+1} \\ d_{i+1,i} & d_{i+1,i+1} \end{pmatrix} \) is a 2 by 2 pivot block and the \( (i + 1) \)th row and column of \( A \) were interchanged with the \( m \)th row and column.

6: \( \text{fail} \) – NagError *

*Input/Output*

The NAG error argument (see Section 3.6 in the Essential Introduction).

6 Error Indicators and Warnings

**NE_ALLOC_FAIL**

Dynamic memory allocation failed.

See Section 3.2.1.2 in the Essential Introduction for further information.

**NE_BAD_PARAM**

On entry, argument \( \langle \text{value} \rangle \) had an illegal value.

**NE_INT**

On entry, \( n = \langle \text{value} \rangle \).

*Constraint:* \( n \geq 0 \).
NE_INTERNAL_ERROR
An internal error has occurred in this function. Check the function call and any array sizes. If the call is correct then please contact NAG for assistance.

An unexpected error has been triggered by this function. Please contact NAG. See Section 3.6.6 in the Essential Introduction for further information.

NE_NO_LICENCE
Your licence key may have expired or may not have been installed correctly. See Section 3.6.5 in the Essential Introduction for further information.

NE_SINGULAR
Element (value) of the diagonal is exactly zero. The factorization has been completed, but the block diagonal matrix $D$ is exactly singular, and division by zero will occur if it is used to solve a system of equations.

7 Accuracy
If $\text{uplo} = \text{Nag}_\text{Upper}$, the computed factors $U$ and $D$ are the exact factors of a perturbed matrix $A + E$, where

$$|E| \leq c(n)\epsilon P|U||D||U^H|P^T,$$

$c(n)$ is a modest linear function of $n$, and $\epsilon$ is the machine precision.

If $\text{uplo} = \text{Nag}_\text{Lower}$, a similar statement holds for the computed factors $L$ and $D$.

8 Parallelism and Performance
nag_zhptrf (f07prc) is not threaded by NAG in any implementation.

nag_zhptrf (f07prc) makes calls to BLAS and/or LAPACK routines, which may be threaded within the vendor library used by this implementation. Consult the documentation for the vendor library for further information.

Please consult the X06 Chapter Introduction for information on how to control and interrogate the OpenMP environment used within this function. Please also consult the Users’ Note for your implementation for any additional implementation-specific information.

9 Further Comments
The elements of $D$ overwrite the corresponding elements of $A$; if $D$ has 2 by 2 blocks, only the upper or lower triangle is stored, as specified by $\text{uplo}$.

The unit diagonal elements of $U$ or $L$ and the 2 by 2 unit diagonal blocks are not stored. The remaining elements of $U$ and $L$ are stored in the corresponding columns of the array $\text{ap}$, but additional row interchanges must be applied to recover $U$ or $L$ explicitly (this is seldom necessary). If $\text{ipiv}[i - 1] = i$, for $i = 1, 2, \ldots, n$ (as is the case when $A$ is positive definite), then $U$ or $L$ are stored explicitly in packed form (except for their unit diagonal elements which are equal to 1).

The total number of real floating-point operations is approximately $\frac{4}{3}n^3$.

A call to nag_zhptrf (f07prc) may be followed by calls to the functions:

nag_zhptrs (f07psc) to solve $AX = B$;
nag_zhpcon (f07puc) to estimate the condition number of $A$;
nag_zhptri (f07pwc) to compute the inverse of $A$.

The real analogue of this function is nag_dsptrf (f07pdc).
10 Example

This example computes the Bunch–Kaufman factorization of the matrix $A$, where

$$A = \begin{pmatrix}
-1.36 + 0.00i & 1.58 + 0.90i & 2.21 - 0.21i & 3.91 + 1.50i \\
1.58 - 0.90i & -8.87 + 0.00i & -1.84 - 0.03i & -1.78 + 1.18i \\
2.21 + 0.21i & -1.84 + 0.03i & -4.63 + 0.00i & 0.11 + 0.11i \\
3.91 - 1.50i & -1.78 - 1.18i & 0.11 - 0.11i & -1.84 + 0.00i
\end{pmatrix},$$

using packed storage.
