1 Purpose
nag_dtptri (f07ujc) computes the inverse of a real triangular matrix, using packed storage.

2 Specification
#include <nag.h>
#include <nagf07.h>
void nag_dtptri (Nag_OrderType order, Nag_UploType uplo, Nag_DiagType diag,
  Integer n, double ap[], NagError *fail)

3 Description
nag_dtptri (f07ujc) forms the inverse of a real triangular matrix $A$, using packed storage. Note that the inverse of an upper (lower) triangular matrix is also upper (lower) triangular.

4 References

5 Arguments
1: order – Nag_OrderType
   
   On entry: the order argument specifies the two-dimensional storage scheme being used, i.e., row-major ordering or column-major ordering. C language defined storage is specified by order = Nag_RowMajor. See Section 3.2.1.3 in the Essential Introduction for a more detailed explanation of the use of this argument.
   
   Constraint: order = Nag_RowMajor or Nag_ColMajor.

2: uplo – Nag_UploType
   
   On entry: specifies whether $A$ is upper or lower triangular.
   
   uplo = Nag_Upper
   $A$ is upper triangular.
   
   uplo = Nag_Lower
   $A$ is lower triangular.
   
   Constraint: uplo = Nag_Upper or Nag_Lower.

3: diag – Nag_DiagType
   
   On entry: indicates whether $A$ is a nonunit or unit triangular matrix.
   
   diag = Nag_NonUnitDiag
   $A$ is a nonunit triangular matrix.
   
   diag = Nag_UnitDiag
   $A$ is a unit triangular matrix; the diagonal elements are not referenced and are assumed to be 1.
   
   Constraint: diag = Nag_NonUnitDiag or Nag_UnitDiag.
**f07ujc**

4:  
   **n** – Integer  
   
   *Input*  
   
   *On entry:* $n$, the order of the matrix $A$.  
   
   *Constraint:* $n \geq 0$.  

5:  
   **ap[**dim]** – double  
   
   *Input/Output*  
   
   *Note:* the dimension, $dim$, of the array $ap$ must be at least $\max(1, n \times (n + 1)/2)$.  
   
   *On entry:* the $n$ by $n$ triangular matrix $A$, packed by rows or columns.  
   
   The storage of elements $A_{ij}$ depends on the *order* and *uplo* arguments as follows:  
   
   if $\text{order} = \text{Nag\_ColMajor}$ and $\text{uplo} = \text{Nag\_Upper}$,  
   
   $A_{ij}$ is stored in $ap[(j - 1) \times j/2 + i - 1]$, for $i \leq j$;  
   
   if $\text{order} = \text{Nag\_ColMajor}$ and $\text{uplo} = \text{Nag\_Lower}$,  
   
   $A_{ij}$ is stored in $ap[(2n - j) \times (j - 1)/2 + i - 1]$, for $i \geq j$;  
   
   if $\text{order} = \text{Nag\_RowMajor}$ and $\text{uplo} = \text{Nag\_Upper}$,  
   
   $A_{ij}$ is stored in $ap[(2n - i) \times (i - 1)/2 + j - 1]$, for $i \leq j$;  
   
   if $\text{order} = \text{Nag\_RowMajor}$ and $\text{uplo} = \text{Nag\_Lower}$,  
   
   $A_{ij}$ is stored in $ap[(i - 1) \times i/2 + j - 1]$, for $i \geq j$.  
   
   If $\text{diag} = \text{Nag\_UnitDiag}$, the diagonal elements of $AP$ are assumed to be 1, and are not referenced; the same storage scheme is used whether $\text{diag} = \text{Nag\_NonUnitDiag}$ or $\text{diag} = \text{Nag\_UnitDiag}$.  
   
   *On exit:* $A$ is overwritten by $A^{-1}$, using the same storage format as described above.  

6:  
   **fail** – NagError*  
   
   *Input/Output*  
   
   The NAG error argument (see Section 3.6 in the Essential Introduction).  

### 6 Error Indicators and Warnings

**NE\_ALLOC\_FAIL**

Dynamic memory allocation failed.  
See Section 3.2.1.2 in the Essential Introduction for further information.

**NE\_BAD\_PARAM**

On entry, argument *(value)* had an illegal value.

**NE\_INT**

On entry, $n = (value)$.  
Constraint: $n \geq 0$.

**NE\_INTERNAL\_ERROR**

An internal error has occurred in this function. Check the function call and any array sizes. If the call is correct then please contact NAG for assistance.  
An unexpected error has been triggered by this function. Please contact NAG.  
See Section 3.6.6 in the Essential Introduction for further information.

**NE\_NO\_LICENCE**

Your licence key may have expired or may not have been installed correctly.  
See Section 3.6.5 in the Essential Introduction for further information.

**NE\_SINGULAR**

Element *(value)* of the diagonal is exactly zero. $A$ is singular its inverse cannot be computed.
7 Accuracy

The computed inverse $X$ satisfies

$$|XA - I| \leq c(n)\epsilon||X||A|,$$

where $c(n)$ is a modest linear function of $n$, and $\epsilon$ is the machine precision.

Note that a similar bound for $|AX - I|$ cannot be guaranteed, although it is almost always satisfied.

The computed inverse satisfies the forward error bound

$$|X - A^{-1}| \leq c(n)\epsilon||A^{-1}||A||X|.$$ 

8 Parallelism and Performance

nag_dtptri (f07ujc) is not threaded by NAG in any implementation.

nag_dtptri (f07ujc) makes calls to BLAS and/or LAPACK routines, which may be threaded within the vendor library used by this implementation. Consult the documentation for the vendor library for further information.

Please consult the X06 Chapter Introduction for information on how to control and interrogate the OpenMP environment used within this function. Please also consult the Users’ Note for your implementation for any additional implementation-specific information.

9 Further Comments

The total number of floating-point operations is approximately $\frac{1}{3}n^3$.

The complex analogue of this function is nag_ztptri (f07uwc).

10 Example

This example computes the inverse of the matrix $A$, where

$$A = \begin{pmatrix}
4.30 & 0.00 & 0.00 & 0.00 \\
-3.96 & -4.87 & 0.00 & 0.00 \\
0.40 & 0.31 & -8.02 & 0.00 \\
-0.27 & 0.07 & -5.95 & 0.12
\end{pmatrix},$$

using packed storage.
