NAG Library Function Document

nag_dtzrzf (f08bhc)

1 Purpose

nag_dtzrzf (f08bhc) reduces the m by n (m ≤ n) real upper trapezoidal matrix A to upper triangular form by means of orthogonal transformations.

2 Specification

```c
#include <nag.h>
#include <nagf08.h>
void nag_dtzrzf (Nag_OrderType order, Integer m, Integer n, double a[],
                  Integer pda, double tau[], NagError *fail)
```

3 Description

The m by n (m ≤ n) real upper trapezoidal matrix A given by

\[ A = \begin{pmatrix} R_1 & R_2 \end{pmatrix}, \]

where \( R_1 \) is an m by m upper triangular matrix and \( R_2 \) is an m by \((n - m)\) matrix, is factorized as

\[ A = \begin{pmatrix} R & 0 \end{pmatrix} Z, \]

where \( R \) is also an m by m upper triangular matrix and \( Z \) is an n by n orthogonal matrix.

4 References

5 Arguments

1: order – Nag_OrderType

*Input*

*On entry:* the order argument specifies the two-dimensional storage scheme being used, i.e., row-major ordering or column-major ordering. C language defined storage is specified by \( \text{order} = \text{Nag_RowMajor} \). See Section 3.2.1.3 in the Essential Introduction for a more detailed explanation of the use of this argument.

*Constraint:* \( \text{order} = \text{Nag_RowMajor} \) or \( \text{Nag_ColMajor} \).

2: m – Integer

*Input*

*On entry:* \( m \), the number of rows of the matrix \( A \).

*Constraint:* \( m \geq 0 \).

3: n – Integer

*Input*

*On entry:* \( n \), the number of columns of the matrix \( A \).

*Constraint:* \( n \geq 0 \).
4: \(a[dim]\) – double

**Note:** the dimension, \(dim\), of the array \(a\) must be at least
\[\max(1, pda \times n)\] when \(order = \text{Nag\_ColMajor}\);
\[\max(1, m \times pda)\] when \(order = \text{Nag\_RowMajor}\).

The \((i,j)\)th element of the matrix \(A\) is stored in
\[a[(j-1) \times pda + i - 1]\] when \(order = \text{Nag\_ColMajor}\);
\[a[(i-1) \times pda + j - 1]\] when \(order = \text{Nag\_RowMajor}\).

**On entry:** the leading \(m\) by \(n\) upper trapezoidal part of the array \(a\) must contain the matrix to be factorized.

**On exit:** the leading \(m\) by \(m\) upper triangular part of \(a\) contains the upper triangular matrix \(R\), and elements \((m+1)\) to \(n\) of the first \(m\) rows of \(a\), with the array \(tau\), represent the orthogonal matrix \(Z\) as a product of \(m\) elementary reflectors (see Section 3.3.6 in the f08 Chapter Introduction).

5: \(pda\) – Integer

**Input**

**On entry:** the stride separating row or column elements (depending on the value of \(order\)) in the array \(a\).

**Constraints:**
\[\begin{align*}
&\text{if } order = \text{Nag\_ColMajor}, \quad pda \geq \max(1, m); \\
&\text{if } order = \text{Nag\_RowMajor}, \quad pda \geq \max(1, n).
\end{align*}\]

6: \(tau[dim]\) – double

**Output**

**Note:** the dimension, \(dim\), of the array \(tau\) must be at least \(\max(1, m)\).

**On exit:** the scalar factors of the elementary reflectors.

7: \(fail\) – NagError *

**Input/Output**

The NAG error argument (see Section 3.6 in the Essential Introduction).

### 6 Error Indicators and Warnings

**NE_ALLOC_FAIL**

Dynamic memory allocation failed.

See Section 3.2.1.2 in the Essential Introduction for further information.

**NE_BAD_PARAM**

On entry, argument \(\langle value\rangle\) had an illegal value.

**NE_INT**

On entry, \(m = \langle value\rangle\).

Constraint: \(m \geq 0\).

On entry, \(n = \langle value\rangle\).

Constraint: \(n \geq 0\).

On entry, \(pda = \langle value\rangle\).

Constraint: \(pda > 0\).

**NE_INT_2**

On entry, \(pda = \langle value\rangle\) and \(m = \langle value\rangle\).

Constraint: \(pda \geq \max(1, m)\).
On entry, $\text{pda} = \langle \text{value} \rangle$ and $n = \langle \text{value} \rangle$.
Constraint: $\text{pda} \geq \max(1,n)$.

**NE_INTERNAL_ERROR**

An internal error has occurred in this function. Check the function call and any array sizes. If the call is correct then please contact NAG for assistance.

An unexpected error has been triggered by this function. Please contact NAG.
See Section 3.6.6 in the Essential Introduction for further information.

**NE_NO_LICENCE**

Your licence key may have expired or may not have been installed correctly.
See Section 3.6.5 in the Essential Introduction for further information.

7 Accuracy

The computed factorization is the exact factorization of a nearby matrix $A + E$, where
\[ \|E\|_2 = O\epsilon\|A\|_2 \]
and $\epsilon$ is the *machine precision*.

8 Parallelism and Performance

$nag_{\text{dtzrzf}}$ (f08bhc) is not threaded by NAG in any implementation.

$nag_{\text{dtzrzf}}$ (f08bhc) makes calls to BLAS and/or LAPACK routines, which may be threaded within the vendor library used by this implementation. Consult the documentation for the vendor library for further information.

Please consult the X06 Chapter Introduction for information on how to control and interrogate the OpenMP environment used within this function. Please also consult the Users’ Note for your implementation for any additional implementation-specific information.

9 Further Comments

The total number of floating-point operations is approximately $4m^2(n - m)$.

The complex analogue of this function is $nag_{\text{ztzrzf}}$ (f08bvc).

10 Example

This example solves the linear least squares problems
\[ \min_x \|b_j - Ax_j\|_2, \quad j = 1, 2 \]
for the minimum norm solutions $x_1$ and $x_2$, where $b_j$ is the $j$th column of the matrix $B$,

\[
A = \begin{pmatrix}
-0.09 & 0.14 & -0.46 & 0.68 & 1.29 \\
-1.56 & 0.20 & 0.29 & 1.09 & 0.51 \\
-1.48 & -0.43 & 0.89 & -0.71 & -0.96 \\
-1.09 & 0.84 & 0.77 & 2.11 & -1.27 \\
0.08 & 0.55 & -1.13 & 0.14 & 1.74 \\
-1.59 & -0.72 & 1.06 & 1.24 & 0.34
\end{pmatrix} \quad \text{and} \quad B = \begin{pmatrix}
7.4 & 2.7 \\
4.2 & -3.0 \\
-8.3 & -9.6 \\
1.8 & 1.1 \\
8.6 & 4.0 \\
2.1 & -5.7
\end{pmatrix}.
\]

The solution is obtained by first obtaining a $QR$ factorization with column pivoting of the matrix $A$, and then the $RZ$ factorization of the leading $k$ by $k$ part of $R$ is computed, where $k$ is the estimated rank of $A$. A tolerance of 0.01 is used to estimate the rank of $A$ from the upper triangular factor, $R$.
