NAG Library Function Document
nag_dsptrd (f08gec)

1 Purpose
nag_dsptrd (f08gec) reduces a real symmetric matrix to tridiagonal form, using packed storage.

2 Specification
#include <nag.h>
#include <nagf08.h>
void nag_dsptrd (Nag_OrderType order, Nag_UploType uplo, Integer n,
               double ap[], double d[], double e[], double tau[], NagError *fail)

3 Description
nag_dsptrd (f08gec) reduces a real symmetric matrix $A$, held in packed storage, to symmetric tridiagonal form $T$ by an orthogonal similarity transformation: $A = QTQ^T$.

The matrix $Q$ is not formed explicitly but is represented as a product of $n - 1$ elementary reflectors (see the f08 Chapter Introduction for details). Functions are provided to work with $Q$ in this representation (see Section 9).

4 References

5 Arguments
1: \textbf{order} – Nag_OrderType \hspace{1cm} \textit{Input}
   
   \textit{On entry}: the \textbf{order} argument specifies the two-dimensional storage scheme being used, i.e., row-major ordering or column-major ordering. C language defined storage is specified by \textbf{order} = Nag_RowMajor. See Section 3.2.1.3 in the Essential Introduction for a more detailed explanation of the use of this argument.
   
   \textit{Constraint}: \textbf{order} = Nag_RowMajor or Nag_ColMajor.

2: \textbf{uplo} – Nag_UploType \hspace{1cm} \textit{Input}
   
   \textit{On entry}: indicates whether the upper or lower triangular part of $A$ is stored.
   
   \textbf{uplo} = Nag_Upper
   
   The upper triangular part of $A$ is stored.
   
   \textbf{uplo} = Nag_Lower
   
   The lower triangular part of $A$ is stored.
   
   \textit{Constraint}: \textbf{uplo} = Nag_Upper or Nag_Lower.

3: \textbf{n} – Integer \hspace{1cm} \textit{Input}
   
   \textit{On entry}: $n$, the order of the matrix $A$.
   
   \textit{Constraint}: $n \geq 0$. 

Mark 25
4: \( \text{ap}[\text{dim}] \) – double

**Note**: the dimension, \( \text{dim} \), of the array \( \text{ap} \) must be at least \( \max(1, n \times (n + 1)/2) \).

**On entry**: the upper or lower triangle of the \( n \) by \( n \) symmetric matrix \( A \), packed by rows or columns.

The storage of elements \( A_{ij} \) depends on the \textbf{order} and \textbf{uplo} arguments as follows:

- If \textbf{order} = Nag_ColMajor and \textbf{uplo} = Nag_Upper, \( A_{ij} \) is stored in \( \text{ap}[(j - 1) \times j/2 + i - 1] \), for \( i \leq j \);
- If \textbf{order} = Nag_ColMajor and \textbf{uplo} = Nag_Lower, \( A_{ij} \) is stored in \( \text{ap}[(2n - j) \times (j - 1)/2 + i - 1] \), for \( i \geq j \);
- If \textbf{order} = Nag_RowMajor and \textbf{uplo} = Nag_Upper, \( A_{ij} \) is stored in \( \text{ap}[(2n - i) \times (i - 1)/2 + j - 1] \), for \( i \leq j \);
- If \textbf{order} = Nag_RowMajor and \textbf{uplo} = Nag_Lower, \( A_{ij} \) is stored in \( \text{ap}[(i - 1) \times i/2 + j - 1] \), for \( i \geq j \).

**On exit**: \( \text{ap} \) is overwritten by the tridiagonal matrix \( T \) and details of the orthogonal matrix \( Q \).

5: \( \text{d}[\text{n}] \) – double

**Output**

**On exit**: the diagonal elements of the tridiagonal matrix \( T \).

6: \( \text{e}[\text{n} - 1] \) – double

**Output**

**On exit**: the off-diagonal elements of the tridiagonal matrix \( T \).

7: \( \text{tau}[\text{n} - 1] \) – double

**Output**

**On exit**: further details of the orthogonal matrix \( Q \).

8: \( \text{fail} \) – NagError *

**Input/Output**

The NAG error argument (see Section 3.6 in the Essential Introduction).

### 6 Error Indicators and Warnings

**NE_ALLOC_FAIL**

Dynamic memory allocation failed.

See Section 3.2.1.2 in the Essential Introduction for further information.

**NE_BAD_PARAM**

On entry, argument \langle value \rangle had an illegal value.

**NE_INT**

On entry, \( n = \langle value \rangle \).

Constraint: \( n \geq 0 \).

**NE_INTERNAL_ERROR**

An internal error has occurred in this function. Check the function call and any array sizes. If the call is correct then please contact NAG for assistance.

An unexpected error has been triggered by this function. Please contact NAG.

See Section 3.6.6 in the Essential Introduction for further information.

**NE_NO_LICENCE**

Your licence key may have expired or may not have been installed correctly.

See Section 3.6.5 in the Essential Introduction for further information.
7  Accuracy

The computed tridiagonal matrix $T$ is exactly similar to a nearby matrix $(A + E)$, where

$$
\|E\|_2 \leq c(n)\epsilon\|A\|_2,
$$

$c(n)$ is a modestly increasing function of $n$, and $\epsilon$ is the *machine precision*.

The elements of $T$ themselves may be sensitive to small perturbations in $A$ or to rounding errors in the computation, but this does not affect the stability of the eigenvalues and eigenvectors.

8  Parallelism and Performance

nag_dsptrd (f08gec) is not threaded by NAG in any implementation.

nag_dsptrd (f08gec) makes calls to BLAS and/or LAPACK routines, which may be threaded within the vendor library used by this implementation. Consult the documentation for the vendor library for further information.

Please consult the X06 Chapter Introduction for information on how to control and interrogate the OpenMP environment used within this function. Please also consult the Users’ Note for your implementation for any additional implementation-specific information.

9  Further Comments

The total number of floating-point operations is approximately $\frac{4}{3}n^3$.

To form the orthogonal matrix $Q$ nag_dsptrd (f08gec) may be followed by a call to nag_dopgtr (f08gfc):

```
  nag_dopgtr(order,uplo,n,ap,tau,&q,pdq,&fail)
```

To apply $Q$ to an $n$ by $p$ real matrix $C$ nag_dsptrd (f08gec) may be followed by a call to nag_dopmtr (f08ggc). For example,

```
  nag_dopmtr(order,Nag_LeftSide,uplo,Nag_NoTrans,n,p,ap,tau,&c,
              pdc,&fail)
```

forms the matrix product $QC$.

The complex analogue of this function is nag_zhptrd (f08gsc).

10  Example

This example reduces the matrix $A$ to tridiagonal form, where

$$
A = \begin{pmatrix}
2.07 & 3.87 & 4.20 & -1.15 \\
3.87 & -0.21 & 1.87 & 0.63 \\
4.20 & 1.87 & 1.15 & 2.06 \\
-1.15 & 0.63 & 2.06 & -1.81
\end{pmatrix},
$$

using packed storage.
