# **NAG Library Function Document**

# nag\_dstein (f08jkc)

# 1 Purpose

nag\_dstein (f08jkc) computes the eigenvectors of a real symmetric tridiagonal matrix corresponding to specified eigenvalues, by inverse iteration.

# 2 Specification

```
#include <nag.h>
#include <nagf08.h>
```

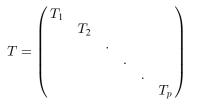

```
void nag_dstein (Nag_OrderType order, Integer n, const double d[],
    const double e[], Integer m, const double w[], const Integer iblock[],
    const Integer isplit[], double z[], Integer pdz, Integer ifailv[],
    NagError *fail)
```

# **3** Description

nag\_dstein (f08jkc) computes the eigenvectors of a real symmetric tridiagonal matrix T corresponding to specified eigenvalues, by inverse iteration (see Jessup and Ipsen (1992)). It is designed to be used in particular after the specified eigenvalues have been computed by nag\_dstebz (f08jjc) with  $rank = Nag_ByBlock$ , but may also be used when the eigenvalues have been computed by other functions in Chapters f02 or f08.

If T has been formed by reduction of a full real symmetric matrix A to tridiagonal form, then eigenvectors of T may be transformed to eigenvectors of A by a call to nag\_dormtr (f08fgc) or nag\_dopmtr (f08ggc).

nag\_dstebz (f08jjc) determines whether the matrix T splits into block diagonal form:

and passes details of the block structure to this function in the arrays **iblock** and **isplit**. This function can then take advantage of the block structure by performing inverse iteration on each block  $T_i$  separately, which is more efficient than using the whole matrix.

# 5 Arguments

### 1: **order** – Nag\_OrderType

On entry: the order argument specifies the two-dimensional storage scheme being used, i.e., rowmajor ordering or column-major ordering. C language defined storage is specified by

Input

 $order = Nag_RowMajor$ . See Section 3.2.1.3 in the Essential Introduction for a more detailed explanation of the use of this argument.

*Constraint*: **order** = Nag\_RowMajor or Nag\_ColMajor.

2:	n – Integer	Input
	On entry: n, the order of the matrix T.	
	Constraint: $\mathbf{n} \ge 0$ .	
3:	$\mathbf{d}[dim]$ – const double	Input
	Note: the dimension, <i>dim</i> , of the array <b>d</b> must be at least $max(1, \mathbf{n})$ .	
	On entry: the diagonal elements of the tridiagonal matrix $T$ .	
4:	$\mathbf{e}[dim]$ – const double	Input
	Note: the dimension, <i>dim</i> , of the array e must be at least $max(1, n - 1)$ .	
	On entry: the off-diagonal elements of the tridiagonal matrix $T$ .	
5:	m – Integer	Input
	On entry: m, the number of eigenvectors to be returned.	
	Constraint: $0 \leq \mathbf{m} \leq \mathbf{n}$ .	
6:	$\mathbf{w}[dim]$ – const double	Input

Note: the dimension, *dim*, of the array w must be at least max(1, n).

On entry: the eigenvalues of the tridiagonal matrix T stored in  $\mathbf{w}[0]$  to  $\mathbf{w}[m-1]$ , as returned by nag\_dstebz (f08jjc) with  $\mathbf{rank} = \text{Nag_ByBlock}$ . Eigenvalues associated with the first sub-matrix must be supplied first, in nondecreasing order; then those associated with the second sub-matrix, again in nondecreasing order; and so on.

*Constraint*: if iblock[i] = iblock[i+1],  $w[i] \le w[i+1]$ , for i = 0, 1, ..., m - 2.

7: **iblock**[dim] – const Integer

Note: the dimension, *dim*, of the array **iblock** must be at least max(1, n).

On entry: the first m elements must contain the sub-matrix indices associated with the specified eigenvalues, as returned by nag\_dstebz (f08jjc) with rank = Nag\_ByBlock. If the eigenvalues were not computed by nag\_dstebz (f08jjc) with rank = Nag\_ByBlock, set iblock [i-1] to 1, for i = 1, 2, ..., m.

Constraint: iblock[i]  $\leq$  iblock[i+1], for  $i = 0, 1, \dots, m-2$ .

8: **isplit**[*dim*] – const Integer

Note: the dimension, *dim*, of the array isplit must be at least  $max(1, \mathbf{n})$ .

On entry: the points at which T breaks up into sub-matrices, as returned by nag\_dstebz (f08jjc) with  $rank = Nag_ByBlock$ . If the eigenvalues were not computed by nag\_dstebz (f08jjc) with  $rank = Nag_ByBlock$ , set isplit[0] to n.

9:  $\mathbf{z}[dim] - double$ 

Note: the dimension, *dim*, of the array z must be at least

 $max(1, pdz \times m)$  when order = Nag\_ColMajor;  $max(1, n \times pdz)$  when order = Nag\_RowMajor. Input

Output

Input

The (i, j)th element of the matrix Z is stored in

 $\mathbf{z}[(j-1) \times \mathbf{pdz} + i - 1]$  when order = Nag\_ColMajor;  $\mathbf{z}[(i-1) \times \mathbf{pdz} + j - 1]$  when order = Nag\_RowMajor.

On exit: the *m* eigenvectors, stored as columns of *Z*; the *i*th column corresponds to the *i*th specified eigenvalue, unless **fail.code** = NE CONVERGENCE (in which case see Section 6).

#### 10: **pdz** – Integer

On entry: the stride separating row or column elements (depending on the value of **order**) in the array z.

Constraints:

if order = Nag\_ColMajor,  $pdz \ge max(1, n)$ ; if order = Nag\_RowMajor,  $pdz \ge max(1, m)$ .

#### 11: ifailv[m] - Integer

On exit: if fail.errnum = i > 0, the first *i* elements of ifaily contain the indices of any eigenvectors which have failed to converge. The rest of the first **m** elements of ifaily are set to 0.

#### 12: fail – NagError \*

The NAG error argument (see Section 3.6 in the Essential Introduction).

### 6 Error Indicators and Warnings

#### NE\_ALLOC\_FAIL

Dynamic memory allocation failed. See Section 3.2.1.2 in the Essential Introduction for further information.

### NE\_BAD\_PARAM

On entry, argument  $\langle value \rangle$  had an illegal value.

#### **NE\_CONSTRAINT**

On entry,  $\mathbf{m} = \langle value \rangle$ ,  $\mathbf{iblock}[i]\mathbf{iblock}[i+1] = \langle value \rangle$  and  $\mathbf{w}[i]\mathbf{w}[i+1] = \langle value \rangle$ . Constraint: , for  $i = 0, 1, ..., \mathbf{m} - 2$ 

#### **NE\_CONVERGENCE**

 $\langle value \rangle$  eigenvectors (as indicated by argument **ifailv**) each failed to converge in five iterations. The current iterate after five iterations is stored in the corresponding column of z.

### NE\_INT

On entry,  $\mathbf{n} = \langle value \rangle$ . Constraint:  $\mathbf{n} \ge 0$ . On entry,  $\mathbf{pdz} = \langle value \rangle$ . Constraint:  $\mathbf{pdz} > 0$ .

#### NE INT 2

On entry,  $\mathbf{m} = \langle value \rangle$  and  $\mathbf{n} = \langle value \rangle$ . Constraint:  $0 \le \mathbf{m} \le \mathbf{n}$ .

On entry,  $\mathbf{pdz} = \langle value \rangle$  and  $\mathbf{m} = \langle value \rangle$ . Constraint:  $\mathbf{pdz} \geq \max(1, \mathbf{m})$ .

On entry,  $\mathbf{pdz} = \langle value \rangle$  and  $\mathbf{n} = \langle value \rangle$ . Constraint:  $\mathbf{pdz} \geq \max(1, \mathbf{n})$ . Input

Output

Input/Output

### NE\_INT\_ARRAY

On entry,  $\mathbf{m} = \langle value \rangle$  and  $\mathbf{iblock}[i]\mathbf{iblock}[i+1] = \langle value \rangle$ . Constraint:  $\mathbf{iblock}[i] \leq \mathbf{iblock}[i+1]$ , for  $i = 0, 1, \dots, \mathbf{m} - 2$ 

### NE\_INTERNAL\_ERROR

An internal error has occurred in this function. Check the function call and any array sizes. If the call is correct then please contact NAG for assistance.

An unexpected error has been triggered by this function. Please contact NAG. See Section 3.6.6 in the Essential Introduction for further information.

### NE\_NO\_LICENCE

Your licence key may have expired or may not have been installed correctly. See Section 3.6.5 in the Essential Introduction for further information.

### 7 Accuracy

Each computed eigenvector  $z_i$  is the exact eigenvector of a nearby matrix  $A + E_i$ , such that

 $||E_i|| = O(\epsilon)||A||,$ 

where  $\epsilon$  is the *machine precision*. Hence the residual is small:

$$||Az_i - \lambda_i z_i|| = O(\epsilon) ||A||.$$

However, a set of eigenvectors computed by this function may not be orthogonal to so high a degree of accuracy as those computed by nag\_dsteqr (f08jec).

# 8 Parallelism and Performance

nag\_dstein (f08jkc) is threaded by NAG for parallel execution in multithreaded implementations of the NAG Library.

nag\_dstein (f08jkc) makes calls to BLAS and/or LAPACK routines, which may be threaded within the vendor library used by this implementation. Consult the documentation for the vendor library for further information.

Please consult the X06 Chapter Introduction for information on how to control and interrogate the OpenMP environment used within this function. Please also consult the Users' Note for your implementation for any additional implementation-specific information.

# 9 Further Comments

The complex analogue of this function is nag\_zstein (f08jxc).

# 10 Example

See Section 10 in nag\_dormtr (f08fgc).
