NAG Library Function Document
nag_dgebrd (f08kec)

1 Purpose
nag_dgebrd (f08kec) reduces a real m by n matrix to bidiagonal form.

2 Specification
#include <nag.h>
#include <nagf08.h>
void nag_dgebrd (Nag_OrderType order, Integer m, Integer n, double a[],
Integer pda, double d[], double e[], double tauq[], double taup[],
NagError *fail)

3 Description
nag_dgebrd (f08kec) reduces a real m by n matrix $A$ to bidiagonal form $B$ by an orthogonal transformation: $A = QBP^T$, where $Q$ and $P^T$ are orthogonal matrices of order $m$ and $n$ respectively.
If $m \geq n$, the reduction is given by:

$$A = Q \begin{pmatrix} B_1 & \ 0 \end{pmatrix} P^T = Q_1 B_1 P_1^T,$$

where $B_1$ is an n by n upper bidiagonal matrix and $Q_1$ consists of the first n columns of $Q$.
If $m < n$, the reduction is given by

$$A = Q \begin{pmatrix} B_1 & \ 0 \end{pmatrix} P^T = Q B_1 P_1^T,$$

where $B_1$ is an m by m lower bidiagonal matrix and $P_1^T$ consists of the first m rows of $P^T$.
The orthogonal matrices $Q$ and $P$ are not formed explicitly but are represented as products of elementary reflectors (see the f08 Chapter Introduction for details). Functions are provided to work with $Q$ and $P$ in this representation (see Section 9).

4 References

5 Arguments
1: order – Nag_OrderType
   
   On entry: the order argument specifies the two-dimensional storage scheme being used, i.e., row-major ordering or column-major ordering. C language defined storage is specified by order = Nag_RowMajor. See Section 3.2.1.3 in the Essential Introduction for a more detailed explanation of the use of this argument.
   
   Constraint: order = Nag_RowMajor or Nag_ColMajor.

2: m – Integer
   
   On entry: m, the number of rows of the matrix $A$.
   
   Constraint: m \geq 0.
3: \(n\) – Integer

\textit{Input}

\textit{On entry:} \(n\), the number of columns of the matrix \(A\).

\textit{Constraint:} \(n \geq 0\).

4: \(a\) \textit{[dim]} – double

\textit{Input/Output}

\textit{Note:} the dimension, \(\text{dim}\), of the array \(a\) must be at least

\[
\max(1, \text{pda} \times n) \text{ when order} = \text{Nag\_ColMajor};
\]

\[
\max(1, m \times \text{pda}) \text{ when order} = \text{Nag\_RowMajor}.
\]

The \((i, j)\)th element of the matrix \(A\) is stored in

\[
a[(j - 1) \times \text{pda} + i - 1] \text{ when order} = \text{Nag\_ColMajor};
\]

\[
a[(i - 1) \times \text{pda} + j - 1] \text{ when order} = \text{Nag\_RowMajor}.
\]

\textit{On entry:} the \(m\) by \(n\) matrix \(A\).

\textit{On exit:} if \(m \geq n\), the diagonal and first superdiagonal are overwritten by the upper bidiagonal matrix \(B\), elements below the diagonal are overwritten by details of the orthogonal matrix \(Q\) and elements above the first superdiagonal are overwritten by details of the orthogonal matrix \(P\).

If \(m < n\), the diagonal and first subdiagonal are overwritten by the lower bidiagonal matrix \(B\), elements below the first subdiagonal are overwritten by details of the orthogonal matrix \(Q\) and elements above the diagonal are overwritten by details of the orthogonal matrix \(P\).

5: \(\text{pda}\) – Integer

\textit{Input}

\textit{On entry:} the stride separating row or column elements (depending on the value of \textit{order}) in the array \(a\).

\textit{Constraints:}

\[
\begin{align*}
\text{if order} &= \text{Nag\_ColMajor}, \text{ pda} \geq \max(1, m); \\
\text{if order} &= \text{Nag\_RowMajor}, \text{ pda} \geq \max(1, n).
\end{align*}
\]

6: \(d\) \textit{[dim]} – double

\textit{Output}

\textit{Note:} the dimension, \(\text{dim}\), of the array \(d\) must be at least \(\max(1, \min(m, n))\).

\textit{On exit:} the diagonal elements of the bidiagonal matrix \(B\).

7: \(e\) \textit{[dim]} – double

\textit{Output}

\textit{Note:} the dimension, \(\text{dim}\), of the array \(e\) must be at least \(\max(1, \min(m, n) - 1)\).

\textit{On exit:} the off-diagonal elements of the bidiagonal matrix \(B\).

8: \(\text{tauq}\) \textit{[dim]} – double

\textit{Output}

\textit{Note:} the dimension, \(\text{dim}\), of the array \(\text{tauq}\) must be at least \(\max(1, \min(m, n))\).

\textit{On exit:} further details of the orthogonal matrix \(Q\).

9: \(\text{taup}\) \textit{[dim]} – double

\textit{Output}

\textit{Note:} the dimension, \(\text{dim}\), of the array \(\text{taup}\) must be at least \(\max(1, \min(m, n))\).

\textit{On exit:} further details of the orthogonal matrix \(P\).

10: \(\text{fail}\) – NagError *

\textit{Input/Output}

The NAG error argument (see Section 3.6 in the Essential Introduction).
6 Error Indicators and Warnings

**NE_ALLOC_FAIL**
Dynamic memory allocation failed.
See Section 3.2.1.2 in the Essential Introduction for further information.

**NE_BAD_PARAM**
On entry, argument \(\text{value}\) had an illegal value.

**NE_INT**
On entry, \(m = \text{value}\).
Constraint: \(m \geq 0\).

On entry, \(n = \text{value}\).
Constraint: \(n \geq 0\).

On entry, \(pda = \text{value}\).
Constraint: \(pda > 0\).

**NE_INT_2**
On entry, \(pda = \text{value}\) and \(m = \text{value}\).
Constraint: \(pda \geq \max(1, m)\).

On entry, \(pda = \text{value}\) and \(n = \text{value}\).
Constraint: \(pda \geq \max(1, n)\).

**NE_INTERNAL_ERROR**
An internal error has occurred in this function. Check the function call and any array sizes. If the call is correct then please contact NAG for assistance.

An unexpected error has been triggered by this function. Please contact NAG.
See Section 3.6.6 in the Essential Introduction for further information.

**NE_NO_LICENCE**
Your licence key may have expired or may not have been installed correctly.
See Section 3.6.5 in the Essential Introduction for further information.

7 Accuracy
The computed bidiagonal form \(B\) satisfies \(QBP^T = A + E\), where
\[
\|E\|_2 \leq c(n)\epsilon\|A\|_2,
\]
c\((n)\) is a modestly increasing function of \(n\), and \(\epsilon\) is the *machine precision*.
The elements of \(B\) themselves may be sensitive to small perturbations in \(A\) or to rounding errors in the computation, but this does not affect the stability of the singular values and vectors.

8 Parallelism and Performance
nag_dgebrd (f08kec) is threaded by NAG for parallel execution in multithreaded implementations of the NAG Library.
nag_dgebrd (f08kec) makes calls to BLAS and/or LAPACK routines, which may be threaded within the vendor library used by this implementation. Consult the documentation for the vendor library for further information.
Please consult the X06 Chapter Introduction for information on how to control and interrogate the OpenMP environment used within this function. Please also consult the Users’ Note for your implementation for any additional implementation-specific information.

9 Further Comments

The total number of floating-point operations is approximately $\frac{4}{3}n^3(3m - n)$ if $m \geq n$ or $\frac{4}{3}m^3(3n - m)$ if $m < n$.

If $m \gg n$, it can be more efficient to first call nag_dgeqrf (f08aec) to perform a QR factorization of $A$, and then to call nag_dgebrd (f08kec) to reduce the factor $R$ to bidiagonal form. This requires approximately $2n^2(m + n)$ floating-point operations.

If $m \ll n$, it can be more efficient to first call nag_dgelqf (f08ahc) to perform an $LQ$ factorization of $A$, and then to call nag_dgebrd (f08kec) to reduce the factor $L$ to bidiagonal form. This requires approximately $2m^2(m + n)$ operations.

To form the orthogonal matrices $P^T$ and/or $Q$ nag_dgebrd (f08kec) may be followed by calls to nag_dorgbr (f08kfc):

- to form the $m$ by $m$ orthogonal matrix $Q$
  
  ```c
  nag_dorgbr(order,Nag_FormQ,m,m,&a,pda,tauq,&fail)
  ```
  but note that the second dimension of the array `a` must be at least `m`, which may be larger than was required by nag_dgebrd (f08kec);

- to form the $n$ by $n$ orthogonal matrix $P^T$
  
  ```c
  nag_dorgbr(order,Nag_FormP,n,n,&a,pda,taup,&fail)
  ```
  but note that the first dimension of the array `a`, specified by the argument `pda`, must be at least `n`, which may be larger than was required by nag_dgebrd (f08kec).

To apply $Q$ or $P$ to a real rectangular matrix $C$, nag_dgebrd (f08kec) may be followed by a call to nag_dormbr (f08kgc).

The complex analogue of this function is nag_zgebrd (f08ksc).

10 Example

This example reduces the matrix $A$ to bidiagonal form, where

$$
A = \begin{pmatrix}
-0.57 & -1.28 & -0.39 & 0.25 \\
-1.93 & 1.08 & -0.31 & -2.14 \\
2.30 & 0.24 & 0.40 & -0.35 \\
-1.93 & 0.64 & -0.66 & 0.08 \\
0.15 & 0.30 & 0.15 & -2.13 \\
-0.02 & 1.03 & -1.43 & 0.50
\end{pmatrix}
$$
