NAG Library Function Document

nag_zgees (f08pnc)

1 Purpose

nag_zgees (f08pnc) computes the eigenvalues, the Schur form $T$, and, optionally, the matrix of Schur vectors $Z$ for an $n$ by $n$ complex nonsymmetric matrix $A$.

2 Specification

```c
#include <nag.h>
#include <nagf08.h>
void nag_zgees (Nag_OrderType order, Nag_JobType jobvs, 
               Nag_SortEigValsType sort, 
               Nag_Boolean (*select)(Complex w),
               Integer n, Complex a[], Integer pda, Integer *sdim, Complex w[],
               Complex vs[], Integer pdvs, NagError *fail)
```

3 Description

The Schur factorization of $A$ is given by

$$A = Z T Z^H,$$

where $Z$, the matrix of Schur vectors, is unitary and $T$ is the Schur form. A complex matrix is in Schur form if it is upper triangular.

Optionally, nag_zgees (f08pnc) also orders the eigenvalues on the diagonal of the Schur form so that selected eigenvalues are at the top left. The leading columns of $Z$ form an orthonormal basis for the invariant subspace corresponding to the selected eigenvalues.

4 References

5 Arguments

1:  **order** – Nag_OrderType  
    *Input*  
    *On entry:* the `order` argument specifies the two-dimensional storage scheme being used, i.e., row-major ordering or column-major ordering. C language defined storage is specified by `order = Nag_RowMajor`. See Section 3.2.1.3 in the Essential Introduction for a more detailed explanation of the use of this argument.  
    *Constraint:* `order = Nag_RowMajor` or `Nag_ColMajor`. 

2:  **jobvs** – Nag_JobType  
    *Input*  
    *On entry:* if `jobvs = Nag_DoNothing`, Schur vectors are not computed.
If `jobvs` = Nag_Schur, Schur vectors are computed.

*Constraint:* `jobvs` = Nag_DoNothing or Nag_Schur.

3: `sort` – Nag_SortEigValsType  
*Input*

*On entry:* specifies whether or not to order the eigenvalues on the diagonal of the Schur form.

- `sort` = Nag_NoSortEigVals
  Eigenvalues are not ordered.

- `sort` = Nag_SortEigVals
  Eigenvalues are ordered (see `select`).

*Constraint:* `sort` = Nag_NoSortEigVals or Nag_SortEigVals.

4: `select` – function, supplied by the user  
*External Function*

*If* `sort` = Nag_SortEigVals, `select` is used to select eigenvalues to sort to the top left of the Schur form.

*If* `sort` = Nag_NoSortEigVals, `select` is not referenced and nag_zgees (f08pnc) may be specified as NULLFN.

An eigenvalue \(w[j-1]\) is selected if `select(w[j-1])` is Nag_TRUE.

The specification of `select` is:

```c
Nag_Boolean select (Complex w)
```

1: `w` – Complex  
*Input*

*On entry:* the real and imaginary parts of the eigenvalue.

5: `n` – Integer  
*Input*

*On entry:* \(n\), the order of the matrix \(A\).

*Constraint:* \(n \geq 0\).

6: `a[dim]` – Complex  
*Input/Output*

*Note:* the dimension, `dim`, of the array `a` must be at least \(\max(1, pda \times n)\).

The \((i, j)\)th element of the matrix \(A\) is stored in

- `a[(j-1) \times pda + i - 1]` when `order` = Nag_ColMajor;
- `a[(i-1) \times pda + j - 1]` when `order` = Nag_RowMajor.

*On entry:* the \(n\) by \(n\) matrix \(A\).

*On exit:* `a` is overwritten by its Schur form \(T\).

7: `pda` – Integer  
*Input*

*On entry:* the stride separating row or column elements (depending on the value of `order`) in the array `a`.

*Constraint:* `pda` \(\geq \max(1, n)\).

8: `sdim` – Integer *  
*Output*

*On exit:* if `sort` = Nag_NoSortEigVals, `sdim` = 0.

If `sort` = Nag_SortEigVals, \(sdim = \) number of eigenvalues for which `select` is Nag_TRUE.

9: `w[dim]` – Complex  
*Output*

*Note:* the dimension, `dim`, of the array `w` must be at least \(\max(1, n)\).
On exit: contains the computed eigenvalues, in the same order that they appear on the diagonal of the output Schur form $T$.

10: \( \text{vs}[\text{dim}] \) – Complex

\textbf{Output}

\textbf{Note:} the dimension, \( \text{dim} \), of the array \( \text{vs} \) must be at least

\[
\max(1, \text{pdvs} \times n) \quad \text{when} \quad \text{jobvs} = \text{Nag\_Schur}; \\
1 \quad \text{otherwise.}
\]

The \( i \)th element of the \( j \)th vector is stored in

\[
\text{vs}[\text{(}j-1\text{)} \times \text{pdvs} + i - 1] \quad \text{when} \quad \text{order} = \text{Nag\_ColMajor}; \\
\text{vs}[\text{(}i-1\text{)} \times \text{pdvs} + j - 1] \quad \text{when} \quad \text{order} = \text{Nag\_RowMajor}.
\]

On exit: if \( \text{jobvs} = \text{Nag\_Schur} \), \( \text{vs} \) contains the unitary matrix \( Z \) of Schur vectors.

If \( \text{jobvs} = \text{Nag\_DoNothing} \), \( \text{vs} \) is not referenced.

11: \( \text{pdvs} \) – Integer

\textbf{Input}

\textit{On entry}: the stride used in the array \( \text{vs} \).

\textbf{Constraints:}

\[
\text{if} \quad \text{jobvs} = \text{Nag\_Schur}, \quad \text{pdvs} \geq \max(1, n); \\
\text{otherwise} \quad \text{pdvs} \geq 1.
\]

12: \( \text{fail} \) – NagError *

\textbf{Input/Output}

The NAG error argument (see Section 3.6 in the Essential Introduction).

6 Error Indicators and Warnings

**NE\_ALLOC\_FAIL**

Dynamic memory allocation failed.

See Section 3.2.1.2 in the Essential Introduction for further information.

**NE\_BAD\_PARAM**

On entry, argument \( \langle \text{value} \rangle \) had an illegal value.

**NE\_CONVERGENCE**

The QR algorithm failed to compute all the eigenvalues.

**NE\_ENUM\_INT\_2**

On entry, \( \text{jobvs} = \langle \text{value} \rangle \), \( \text{pdvs} = \langle \text{value} \rangle \) and \( n = \langle \text{value} \rangle \).

\textbf{Constraint:} if \( \text{jobvs} = \text{Nag\_Schur} \), \( \text{pdvs} \geq \max(1, n) \); otherwise \( \text{pdvs} \geq 1 \).

**NE\_INT**

On entry, \( n = \langle \text{value} \rangle \).

\textbf{Constraint:} \( n \geq 0 \).

On entry, \( \text{pda} = \langle \text{value} \rangle \).

\textbf{Constraint:} \( \text{pda} > 0 \).

On entry, \( \text{pdvs} = \langle \text{value} \rangle \).

\textbf{Constraint:} \( \text{pdvs} > 0 \).

Mark 25
On entry, $pda = \langle \text{value} \rangle$ and $n = \langle \text{value} \rangle$.
Constraint: $pda \geq \max(1, n)$.

An internal error has occurred in this function. Check the function call and any array sizes. If the call is correct then please contact NAG for assistance.
An unexpected error has been triggered by this function. Please contact NAG. See Section 3.6.6 in the Essential Introduction for further information.

Your licence key may have expired or may not have been installed correctly. See Section 3.6.5 in the Essential Introduction for further information.

The eigenvalues could not be reordered because some eigenvalues were too close to separate (the problem is very ill-conditioned).

After reordering, roundoff changed values of some complex eigenvalues so that leading eigenvalues in the Schur form no longer satisfy $\text{select} = \text{Nag\_TRUE}$. This could also be caused by underflow due to scaling.

The computed Schur factorization satisfies
\[ A + E = ZTZ^H, \]
where
\[ \|E\|_2 = O(\epsilon\|A\|_2), \]
and $\epsilon$ is the machine precision. See Section 4.8 of Anderson et al. (1999) for further details.

nag_zgees (f08pnc) is threaded by NAG for parallel execution in multithreaded implementations of the NAG Library.

nag_zgees (f08pnc) makes calls to BLAS and/or LAPACK routines, which may be threaded within the vendor library used by this implementation. Consult the documentation for the vendor library for further information.

Please consult the X06 Chapter Introduction for information on how to control and interrogate the OpenMP environment used within this function. Please also consult the Users’ Note for your implementation for any additional implementation-specific information.

The total number of floating-point operations is proportional to $n^3$.
The real analogue of this function is nag_dgees (f08pac).
10 Example

This example finds the Schur factorization of the matrix

\[
A = \begin{pmatrix}
-3.97 - 5.04i & -4.11 + 3.70i & -0.34 + 1.01i & 1.29 - 0.86i \\
0.34 - 1.50i & 1.52 - 0.43i & 1.88 - 5.38i & 3.36 + 0.65i \\
3.31 - 3.85i & 2.50 + 3.45i & 0.88 - 1.08i & 0.64 - 1.48i \\
-1.10 + 0.82i & 1.81 - 1.59i & 3.25 + 1.33i & 1.57 - 3.44i
\end{pmatrix}
\]
