NAG Library Function Document
nag_zgeesx (f08ppc)

1 Purpose

nag_zgeesx (f08ppc) computes the eigenvalues, the Schur form $T$, and, optionally, the matrix of Schur vectors $Z$ for an $n$ by $n$ complex nonsymmetric matrix $A$.

2 Specification

```c
#include <nag.h>
#include <nagf08.h>

void nag_zgeesx (Nag_OrderType order, Nag_JobType jobvs,
                  Nag_SortEigValsType sort,
                  Nag_Boolean (*select)(Complex w),
                  Nag_RCondType sense, Integer n, Complex a[], Integer pda,
                  Integer *sdim, Complex w[], Complex vs[], Integer pdvs,
                  double *rconde, double *rcondv,
                  NagError *fail)
```

3 Description

The Schur factorization of $A$ is given by

$$A = Z T Z^H,$$

where $Z$, the matrix of Schur vectors, is unitary and $T$ is the Schur form. A complex matrix is in Schur form if it is upper triangular.

Optionally, nag_zgeesx (f08ppc) also orders the eigenvalues on the diagonal of the Schur form so that selected eigenvalues are at the top left; computes a reciprocal condition number for the average of the selected eigenvalues ($rconde$); and computes a reciprocal condition number for the right invariant subspace corresponding to the selected eigenvalues ($rcondv$). The leading columns of $Z$ form an orthonormal basis for this invariant subspace.

For further explanation of the reciprocal condition numbers $rconde$ and $rcondv$, see Section 4.8 of Anderson et al. (1999) (where these quantities are called $s$ and $sep$ respectively).

4 References

5 Arguments

1:  **order** – Nag_OrderType  

*Input*

*On entry:* the *order* argument specifies the two-dimensional storage scheme being used, i.e., row-major ordering or column-major ordering. C language defined storage is specified by *order* = Nag_RowMajor. See Section 3.2.1.3 in the Essential Introduction for a more detailed explanation of the use of this argument.

*Constraint:* *order* = Nag_RowMajor or Nag_ColMajor.
2:  jobvs – Nag_JobType

   Input

   On entry: if jobvs = Nag_DoNothing, Schur vectors are not computed.
   If jobvs = Nag_Schur, Schur vectors are computed.
   Constraint: jobvs = Nag_DoNothing or Nag_Schur.

3:  sort – Nag_SortEigValsType

   Input

   On entry: specifies whether or not to order the eigenvalues on the diagonal of the Schur form.
   sort = Nag_NoSortEigVals
       Eigenvalues are not ordered.
   sort = Nag_SortEigVals
       Eigenvalues are ordered (see select).
   Constraint: sort = Nag_NoSortEigVals or Nag_SortEigVals.

4:  select – function, supplied by the user

   External Function

   If sort = Nag_SortEigVals, select is used to select eigenvalues to sort to the top left of the Schur form.
   If sort = Nag_NoSortEigVals, select is not referenced and nag_zgeesx (f08ppc) may be specified as NULLFN.
   An eigenvalue \( w[j-1] \) is selected if select\( (w[j-1]) \) is Nag_TRUE.

   The specification of select is:

   Nag_Boolean select (Complex w)

   1:  w – Complex

      Input

      On entry: the real and imaginary parts of the eigenvalue.

5:  sense – Nag_RCondType

   Input

   On entry: determines which reciprocal condition numbers are computed.
   sense = Nag_NotRCond
       None are computed.
   sense = Nag_RCondEigVals
       Computed for average of selected eigenvalues only.
   sense = Nag_RCondEigVecs
       Computed for selected right invariant subspace only.
   sense = Nag_RCondBoth
       Computed for both.
   If sense = Nag_RCondEigVals, Nag_RCondEigVecs or Nag_RCondBoth, sort = Nag_SortEigVals.
   Constraint: sense = Nag_NotRCond, Nag_RCondEigVals, Nag_RCondEigVecs or Nag_RCondBoth.

6:  n – Integer

   Input

   On entry: \( n \), the order of the matrix \( A \).
   Constraint: \( n \geq 0 \).

7:  a[dim] – Complex

   Input/Output

   Note: the dimension, \( dim \), of the array a must be at least \( \max(1, pda \times n) \).
The \((i, j)\)th element of the matrix \(A\) is stored in
\[
a[(j - 1) \times \text{pda} + i - 1] \quad \text{when} \quad \text{order} = \text{Nag}_\text{ColMajor};
\]
\[
a[(i - 1) \times \text{pda} + j - 1] \quad \text{when} \quad \text{order} = \text{Nag}_\text{RowMajor}.
\]

**On entry:** the \(n\) by \(n\) matrix \(A\).

**On exit:** \(a\) is overwritten by its Schur form \(T\).

8: \(\text{pda} \quad - \quad \text{Integer} \quad \text {Input}\)

*On entry:* the stride separating row or column elements (depending on the value of \text{order}) in the array \(a\).

*Constraint:* \(\text{pda} \geq \max(1, n)\).

9: \(\text{sdim} \quad - \quad \text{Integer} \quad * \quad \text {Output}\)

*On exit:* if \(\text{sort} = \text{Nag}_\text{NoSortEigVals}, \text{sdim} = 0\).

If \(\text{sort} = \text{Nag}_\text{SortEigVals}, \text{sdim} = \) number of eigenvalues for which \text{select} is \text{Nag}_\text{TRUE}.

10: \(\text{w}[\text{dim}] \quad - \quad \text{Complex} \quad \text {Output}\)

*Note:* the dimension, \(\text{dim}\), of the array \(\text{w}\) must be at least \(\max(1, n)\).

*On exit:* contains the computed eigenvalues, in the same order that they appear on the diagonal of the output Schur form \(T\).

11: \(\text{vs}[\text{dim}] \quad - \quad \text{Complex} \quad \text {Output}\)

*Note:* the dimension, \(\text{dim}\), of the array \(\text{vs}\) must be at least
\[
\max(1, \text{pdvs} \times n) \quad \text{when} \quad \text{jobvs} = \text{Nag}_\text{Schur};
\]
1 otherwise.

The \(i\)th element of the \(j\)th vector is stored in
\[
\text{vs}[(j - 1) \times \text{pdvs} + i - 1] \quad \text{when} \quad \text{order} = \text{Nag}_\text{ColMajor};
\]
\[
\text{vs}[(i - 1) \times \text{pdvs} + j - 1] \quad \text{when} \quad \text{order} = \text{Nag}_\text{RowMajor}.
\]

*On exit:* if \(\text{jobvs} = \text{Nag}_\text{Schur}, \text{vs}\) contains the unitary matrix \(Z\) of Schur vectors.

If \(\text{jobvs} = \text{Nag}_\text{DoNothing}, \text{vs}\) is not referenced.

12: \(\text{pdvs} \quad - \quad \text{Integer} \quad \text {Input}\)

*On entry:* the stride used in the array \(\text{vs}\).

*Constraints:*

\[
\text{if} \quad \text{jobvs} = \text{Nag}_\text{Schur}, \quad \text{pdvs} \geq \max(1, n);\]
\[
\text{otherwise} \quad \text{pdvs} \geq 1.
\]

13: \(\text{rconde} \quad - \quad \text{double} \quad * \quad \text {Output}\)

*On exit:* if \(\text{sense} = \text{Nag}_\text{RCondEigVals}\) or \text{Nag}_\text{RCondBoth}, contains the reciprocal condition number for the average of the selected eigenvalues.

If \(\text{sense} = \text{Nag}_\text{NotRCond}\) or \text{Nag}_\text{RCondEigVecs}, \(\text{rconde}\) is not referenced.

14: \(\text{rcondv} \quad - \quad \text{double} \quad * \quad \text {Output}\)

*On exit:* if \(\text{sense} = \text{Nag}_\text{RCondEigVals}\) or \text{Nag}_\text{RCondBoth}, \(\text{rcondv}\) contains the reciprocal condition number for the selected right invariant subspace.

If \(\text{sense} = \text{Nag}_\text{NotRCond}\) or \text{Nag}_\text{RCondEigVals}, \(\text{rcondv}\) is not referenced.
6 Error Indicators and Warnings

NE_ALLOC_FAIL
Dynamic memory allocation failed.
See Section 3.2.1.2 in the Essential Introduction for further information.

NE_BAD_PARAM
On entry, argument <value> had an illegal value.

NE_CONVERGENCE
The QR algorithm failed to compute all the eigenvalues.

NE_ENUM_INT_2
On entry, jobvs = <value>, pdvs = <value> and n = <value>.
Constraint: if jobvs = Nag_Schur, pdvs ≥ max(1, n);
otherwise pdvs ≥ 1.

NE_INT
On entry, n = <value>.
Constraint: n ≥ 0.
On entry, pda = <value>.
Constraint: pda > 0.
On entry, pdvs = <value>.
Constraint: pdvs > 0.

NE_INT_2
On entry, pda = <value> and n = <value>.
Constraint: pda ≥ max(1, n).

NE_INTERNAL_ERROR
An internal error has occurred in this function. Check the function call and any array sizes. If the call is correct then please contact NAG for assistance.

An unexpected error has been triggered by this function. Please contact NAG.
See Section 3.6.6 in the Essential Introduction for further information.

NE_NO_LICENCE
Your licence key may have expired or may not have been installed correctly.
See Section 3.6.5 in the Essential Introduction for further information.

NE_SCHUR_REORDER
The eigenvalues could not be reordered because some eigenvalues were too close to separate (the problem is very ill-conditioned).

NE_SCHUR_REORDER_SELECT
After reordering, roundoff changed values of some complex eigenvalues so that leading eigenvalues in the Schur form no longer satisfy select = Nag_TRUE. This could also be caused by underflow due to scaling.
7 Accuracy
The computed Schur factorization satisfies
\[ A + E = ZTZ^H, \]
where
\[ \|E\|_2 = O(\epsilon)\|A\|_2, \]
and \( \epsilon \) is the machine precision. See Section 4.8 of Anderson et al. (1999) for further details.

8 Parallelism and Performance
nag_zgeesx (f08ppc) is threaded by NAG for parallel execution in multithreaded implementations of the NAG Library.
nag_zgeesx (f08ppc) makes calls to BLAS and/or LAPACK routines, which may be threaded within the vendor library used by this implementation. Consult the documentation for the vendor library for further information.

Please consult the X06 Chapter Introduction for information on how to control and interrogate the OpenMP environment used within this function. Please also consult the Users’ Note for your implementation for any additional implementation-specific information.

9 Further Comments
The total number of floating-point operations is proportional to \( n^3 \).
The real analogue of this function is nag_dgeesx (f08pbc).

10 Example
This example finds the Schur factorization of the matrix
\[
A = \begin{pmatrix}
-3.97 - 5.04i & -4.11 + 3.70i & -0.34 + 1.01i & 1.29 - 0.86i \\
0.34 - 1.50i & 1.52 - 0.43i & 1.88 - 5.38i & 3.36 + 0.65i \\
3.31 - 3.85i & 2.50 + 3.45i & 0.88 - 1.08i & 0.64 - 1.48i \\
-1.10 + 0.82i & 1.81 - 1.59i & 3.25 + 1.33i & 1.57 - 3.44i
\end{pmatrix},
\]
such that the eigenvalues of \( A \) with positive real part of are the top left diagonal elements of the Schur form, \( T \). Estimates of the condition numbers for the selected eigenvalue cluster and corresponding invariant subspace are also returned.
