NAG Library Function Document
nag_zhpgv (f08tnc)

1 Purpose
nag_zhpgv (f08tnc) computes all the eigenvalues and, optionally, all the eigenvectors of a complex
generalized Hermitian-definite eigenproblem, of the form

\[ Az = \lambda Bz, \quad ABz = \lambda z \quad \text{or} \quad BAz = \lambda z, \]

where A and B are Hermitian, stored in packed format, and B is also positive definite.

2 Specification

```c
#include <nag.h>
#include <nagf08.h>

void nag_zhpgv (Nag_OrderType order, Integer itype, Nag_JobType job,
                 Nag_UploType uplo, Integer n, Complex ap[], Complex bp[], double w[],
                 Complex z[], Integer pdz, NagError *fail)
```

3 Description

nag_zhpgv (f08tnc) first performs a Cholesky factorization of the matrix B as \( B = U^H U \), when
uplo = Nag_Upper or \( B = LL^H \), when uplo = Nag_Lower. The generalized problem is then reduced to a
standard symmetric eigenvalue problem

\[ Cx = \lambda x, \]

which is solved for the eigenvalues and, optionally, the eigenvectors; the eigenvectors are then
backtransformed to give the eigenvectors of the original problem.

For the problem \( Az = \lambda Bz \), the eigenvectors are normalized so that the matrix of eigenvectors, \( Z \),
satisfies

\[ Z^H AZ = A \quad \text{and} \quad Z^H BZ = I, \]

where \( A \) is the diagonal matrix whose diagonal elements are the eigenvalues. For the problem \( ABz = \lambda z \)
we correspondingly have

\[ Z^{-1} AZ^{-H} = A \quad \text{and} \quad Z^H BZ = I, \]

and for \( BAz = \lambda z \) we have

\[ Z^H AZ = A \quad \text{and} \quad Z^H B^{-1} Z = I. \]

5 Arguments

1: **order** – Nag_OrderType
   
   *Input*

   *On entry:* the **order** argument specifies the two-dimensional storage scheme being used, i.e., row-major ordering or column-major ordering. C language defined storage is specified by **order** = Nag_RowMajor. See Section 3.2.1.3 in the Essential Introduction for a more detailed explanation of the use of this argument.

   *Constraint:* **order** = Nag_RowMajor or Nag_ColMajor.

2: **itype** – Integer
   
   *Input*

   *On entry:* specifies the problem type to be solved.

   - **itype** = 1
     
     \[ A_z = \lambda B_z. \]

   - **itype** = 2
     
     \[ ABz = \lambda z. \]

   - **itype** = 3
     
     \[ BAz = \lambda z. \]

   *Constraint:* **itype** = 1, 2 or 3.

3: **job** – Nag_JobType
   
   *Input*

   *On entry:* indicates whether eigenvectors are computed.

   - **job** = Nag_EigVals
     Only eigenvalues are computed.

   - **job** = Nag_DoBoth
     Eigenvalues and eigenvectors are computed.

   *Constraint:* **job** = Nag_EigVals or Nag_DoBoth.

4: **uplo** – Nag_UploType
   
   *Input*

   *On entry:* if **uplo** = Nag_Upper, the upper triangles of \( A \) and \( B \) are stored.

   If **uplo** = Nag_Lower, the lower triangles of \( A \) and \( B \) are stored.

   *Constraint:* **uplo** = Nag_Upper or Nag_Lower.

5: **n** – Integer
   
   *Input*

   *On entry:* \( n \), the order of the matrices \( A \) and \( B \).

   *Constraint:* \( n \geq 0 \).

6: **ap[dim]** – Complex
   
   *Input/Output*

   *Note:* the dimension, \( dim \), of the array **ap** must be at least \( \max(1, n \times (n + 1)/2) \).

   *On entry:* the upper or lower triangle of the \( n \) by \( n \) Hermitian matrix \( A \), packed by rows or columns.

   The storage of elements \( A_{ij} \) depends on the **order** and **uplo** arguments as follows:

   - If **order** = Nag_ColMajor and **uplo** = Nag_Upper, \( A_{ij} \) is stored in \( \text{ap}[j - 1] \times j/2 + i - 1] \), for \( i \leq j \);
   - If **order** = Nag_ColMajor and **uplo** = Nag_Lower, \( A_{ij} \) is stored in \( \text{ap}[(2n - j) \times (j - 1)/2 + i - 1] \), for \( i \geq j \);
   - If **order** = Nag_RowMajor and **uplo** = Nag_Upper, \( A_{ij} \) is stored in \( \text{ap}[(2n - i) \times (i - 1)/2 + j - 1] \), for \( i \leq j \);
if \( \text{order} = \text{Nag\_RowMajor} \) and \( \text{uplo} = \text{Nag\_Lower} \),
\( A_{ij} \) is stored in \( \text{ap}[((i-1) \times i)/2 + j - 1] \), for \( i \geq j \).

On exit: the contents of \( \text{ap} \) are destroyed.

7: \( \text{bp}[\text{dim}] \) – Complex
   \text{Input/Output}

Note: the dimension, \( \text{dim} \), of the array \( \text{bp} \) must be at least \( \max(1, n \times (n + 1)/2) \).

On entry: the upper or lower triangle of the \( n \) by \( n \) Hermitian matrix \( B \), packed by rows or columns.

The storage of elements \( B_{ij} \) depends on the \text{order} and \text{uplo} arguments as follows:

   if \( \text{order} = \text{Nag\_ColMajor} \) and \( \text{uplo} = \text{Nag\_Upper} \),
   \( B_{ij} \) is stored in \( \text{bp}[(j - 1) \times j/2 + i - 1] \), for \( i \leq j \);
   if \( \text{order} = \text{Nag\_ColMajor} \) and \( \text{uplo} = \text{Nag\_Lower} \),
   \( B_{ij} \) is stored in \( \text{bp}[(2n - j) \times (j - 1)/2 + i - 1] \), for \( i \geq j \);
   if \( \text{order} = \text{Nag\_RowMajor} \) and \( \text{uplo} = \text{Nag\_Upper} \),
   \( B_{ij} \) is stored in \( \text{bp}[(2n - i) \times (i - 1)/2 + j - 1] \), for \( i \leq j \);
   if \( \text{order} = \text{Nag\_RowMajor} \) and \( \text{uplo} = \text{Nag\_Lower} \),
   \( B_{ij} \) is stored in \( \text{bp}[(i - 1) \times i/2 + j - 1] \), for \( i \geq j \).

On exit: the triangular factor \( U \) or \( L \) from the Cholesky factorization \( B = U^H U \) or \( B = LL^H \), in the same storage format as \( B \).

8: \( \text{w}[n] \) – double
   \text{Output}

On exit: the eigenvalues in ascending order.

9: \( \text{z}[\text{dim}] \) – Complex
   \text{Output}

Note: the dimension, \( \text{dim} \), of the array \( \text{z} \) must be at least \( \max(1, \text{pdz} \times n) \) when \( \text{job} = \text{Nag\_DoBoth} \);
1 otherwise.

The \((i, j)\)th element of the matrix \( Z \) is stored in

   \( \text{z}[(j - 1) \times \text{pdz} + i - 1] \) when \text{order} = \text{Nag\_ColMajor};
   \( \text{z}[(i - 1) \times \text{pdz} + j - 1] \) when \text{order} = \text{Nag\_RowMajor}.

On exit: if \( \text{job} = \text{Nag\_DoBoth} \), \( \text{z} \) contains the matrix \( Z \) of eigenvectors. The eigenvectors are normalized as follows:

   if \( \text{itype} = 1 \) or \( 2 \), \( Z^H B Z = I \);
   if \( \text{itype} = 3 \), \( Z^H B^{-1} Z = I \).

If \( \text{job} = \text{Nag\_EigVals} \), \( \text{z} \) is not referenced.

10: \( \text{pdz} \) – Integer
    \text{Input}

On entry: the stride separating row or column elements (depending on the value of \text{order}) in the array \( \text{z} \).

Constraints:

   if \( \text{job} = \text{Nag\_DoBoth} \), \( \text{pdz} \geq \max(1, n) \);
   otherwise \( \text{pdz} \geq 1 \).

11: \( \text{fail} \) – Nag\_Error*
    \text{Input/Output}

The NAG error argument (see Section 3.6 in the Essential Introduction).
6 Error Indicators and Warnings

**NE_ALLOC_FAIL**
Dynamic memory allocation failed. See Section 3.2.1.2 in the Essential Introduction for further information.

**NE_BAD_PARAM**
On entry, argument \( \langle \text{value} \rangle \) had an illegal value.

**NE_CONVERGENCE**
The algorithm failed to converge; \( \langle \text{value} \rangle \) off-diagonal elements of an intermediate tridiagonal form did not converge to zero.

**NE_ENUM_INT_2**
On entry, \( \text{job} = \langle \text{value} \rangle \), \( \text{pdz} = \langle \text{value} \rangle \) and \( \text{n} = \langle \text{value} \rangle \).
Constraint: if \( \text{job} = \text{Nag_DoBoth} \), \( \text{pdz} \geq \max(1, \text{n}) \); otherwise \( \text{pdz} \geq 1 \).

**NE_INT**
On entry, \( \text{itype} = \langle \text{value} \rangle \).
Constraint: \( \text{itype} \) = 1, 2 or 3.

On entry, \( \text{n} = \langle \text{value} \rangle \).
Constraint: \( \text{n} \geq 0 \).

On entry, \( \text{pdz} = \langle \text{value} \rangle \).
Constraint: \( \text{pdz} > 0 \).

**NE_INTERNAL_ERROR**
An internal error has occurred in this function. Check the function call and any array sizes. If the call is correct then please contact NAG for assistance.

An unexpected error has been triggered by this function. Please contact NAG. See Section 3.6.6 in the Essential Introduction for further information.

**NE_MAT_NOT_POS_DEF**
If \( \text{fail.errnum} = \text{n} + \langle \text{value} \rangle \), for \( 1 \leq \langle \text{value} \rangle \leq \text{n} \), then the leading minor of order \( \langle \text{value} \rangle \) of \( B \) is not positive definite. The factorization of \( B \) could not be completed and no eigenvalues or eigenvectors were computed.

**NE_NO_LICENCE**
Your licence key may have expired or may not have been installed correctly. See Section 3.6.5 in the Essential Introduction for further information.

7 Accuracy

If \( B \) is ill-conditioned with respect to inversion, then the error bounds for the computed eigenvalues and vectors may be large, although when the diagonal elements of \( B \) differ widely in magnitude the eigenvalues and eigenvectors may be less sensitive than the condition of \( B \) would suggest. See Section 4.10 of Anderson et al. (1999) for details of the error bounds.

The example program below illustrates the computation of approximate error bounds.
8 Parallelism and Performance

nag_zhpgv (f08tnc) is threaded by NAG for parallel execution in multithreaded implementations of the NAG Library.

nag_zhpgv (f08tnc) makes calls to BLAS and/or LAPACK routines, which may be threaded within the vendor library used by this implementation. Consult the documentation for the vendor library for further information.

Please consult the X06 Chapter Introduction for information on how to control and interrogate the OpenMP environment used within this function. Please also consult the Users’ Note for your implementation for any additional implementation-specific information.

9 Further Comments

The total number of floating-point operations is proportional to \( n^3 \).

The real analogue of this function is nag_dspgv (f08tac).

10 Example

This example finds all the eigenvalues and eigenvectors of the generalized Hermitian eigenproblem

\[
A z = \lambda B z,
\]

where

\[
A = \begin{pmatrix}
-7.36 & 0.77 - 0.43i & -0.64 - 0.92i & 3.01 - 6.97i \\
0.77 + 0.43i & 3.49 & 2.19 + 4.45i & 1.90 + 3.73i \\
-0.64 + 0.92i & 2.19 - 4.45i & 0.12 & 2.88 - 3.17i \\
3.01 + 6.97i & 1.90 - 3.73i & 2.88 + 3.17i & -2.54
\end{pmatrix}
\]

and

\[
B = \begin{pmatrix}
3.23 & 1.51 - 1.92i & 1.90 + 0.84i & 0.42 + 2.50i \\
1.51 + 1.92i & 3.58 & -0.23 + 1.11i & -1.18 + 1.37i \\
1.90 - 0.84i & -0.23 - 1.11i & 4.09 & 2.33 - 0.14i \\
0.42 - 2.50i & -1.18 - 1.37i & 2.33 + 0.14i & 4.29
\end{pmatrix},
\]

together with an estimate of the condition number of \( B \), and approximate error bounds for the computed eigenvalues and eigenvectors.

The example program for nag_zhpgvd (f08tqc) illustrates solving a generalized symmetric eigenproblem of the form \( AB z = \lambda z \).
