1 Purpose
nag_zhpgvx (f08tpc) computes selected eigenvalues and, optionally, eigenvectors of a complex
generalized Hermitian-definite eigenproblem, of the form

\[ A z = \lambda B z, \quad AB z = \lambda z \quad \text{or} \quad BA z = \lambda z, \]

where \( A \) and \( B \) are Hermitian, stored in packed format, and \( B \) is also positive definite. Eigenvalues and
eigenvectors can be selected by specifying either a range of values or a range of indices for the desired
eigenvalues.

2 Specification

```c
#include <nag.h>
#include <nagf08.h>

void nag_zhpgvx (Nag_OrderType order, Integer itype, Nag_JobType job,
                 Nag_RangeType range, Nag_UploType uplo, Integer n, Complex ap[],
                 Complex bp[], double vl, double vu, Integer il, Integer iu,
                 double abstol, Integer *m, double w[], Complex z[], Integer pdz,
                 Integer jfail[], NagError *fail)
```

3 Description
nag_zhpgvx (f08tpc) first performs a Cholesky factorization of the matrix \( B \) as \( B = U^H U \), when
\( \text{uplo} = \text{Nag}_\text{Upper} \) or \( B = LL^H \), when \( \text{uplo} = \text{Nag}_\text{Lower} \). The generalized problem is then reduced to a
standard symmetric eigenvalue problem

\[ C x = \lambda x, \]

which is solved for the desired eigenvalues and eigenvectors; the eigenvectors are then backtransformed
to give the eigenvectors of the original problem.

For the problem \( A z = \lambda B z \), the eigenvectors are normalized so that the matrix of eigenvectors, \( Z \),
satisfies

\[ Z^H A Z = \Lambda \quad \text{and} \quad Z^H B Z = I, \]

where \( \Lambda \) is the diagonal matrix whose diagonal elements are the eigenvalues. For the problem \( AB z = \lambda z \)
we correspondingly have

\[ Z^{-1} A Z^{-H} = \Lambda \quad \text{and} \quad Z^H B Z = I, \]

and for \( BA z = \lambda z \) we have

\[ Z^H A Z = \Lambda \quad \text{and} \quad Z^H B^{-1} Z = I. \]
4 References

5 Arguments

1: \textbf{order} – Nag_OrderType \hspace{1cm} \textit{Input}

\textit{On entry:} the \textbf{order} argument specifies the two-dimensional storage scheme being used, i.e., row-major ordering or column-major ordering. C language defined storage is specified by \textbf{order} = Nag_RowMajor. See Section 3.2.1.3 in the Essential Introduction for a more detailed explanation of the use of this argument.

\textit{Constraint:} order = Nag_RowMajor or Nag_ColMajor.

2: \textbf{itype} – Integer \hspace{1cm} \textit{Input}

\textit{On entry:} specifies the problem type to be solved.

\textbf{itype} = 1  
\text{Az} = \lambda Bz.

\textbf{itype} = 2  
\text{ABz} = \lambda z.

\textbf{itype} = 3  
\text{BAz} = \lambda z.

\textit{Constraint:} itype = 1, 2 or 3.

3: \textbf{job} – Nag_JobType \hspace{1cm} \textit{Input}

\textit{On entry:} indicates whether eigenvectors are computed.

\textbf{job} = Nag_EigVals  
Only eigenvalues are computed.

\textbf{job} = Nag_DoBoth  
Eigenvalues and eigenvectors are computed.

\textit{Constraint:} job = Nag_EigVals or Nag_DoBoth.

4: \textbf{range} – Nag_RangeType \hspace{1cm} \textit{Input}

\textit{On entry:} if \textbf{range} = Nag_AllValues, all eigenvalues will be found.

\textit{If} range = Nag_Interval, all eigenvalues in the half-open interval \([vl, vu]\) will be found.

\textit{If} range = Nag_Indices, the \textit{i}th to \textit{u}th eigenvalues will be found.

\textit{Constraint:} range = Nag_AllValues, Nag_Interval or Nag_Indices.

5: \textbf{uplo} – Nag_UploType \hspace{1cm} \textit{Input}

\textit{On entry:} if \textbf{uplo} = Nag_Upper, the upper triangles of \(A\) and \(B\) are stored.

\textit{If} uplo = Nag_Lower, the lower triangles of \(A\) and \(B\) are stored.

\textit{Constraint:} uplo = Nag_Upper or Nag_Lower.
6: \( n \) – Integer

\textit{On entry:} \( n \), the order of the matrices \( A \) and \( B \).

\textit{Constraint:} \( n \geq 0 \).

7: \( \text{ap}[\text{dim}] \) – Complex

\textit{Input/Output}

\textit{Note:} the dimension, \( \text{dim} \), of the array \( \text{ap} \) must be at least \( \max(1, n \times (n + 1)/2) \).

\textit{On entry:} the upper or lower triangle of the \( n \) by \( n \) Hermitian matrix \( A \), packed by rows or columns.

The storage of elements \( A_{ij} \) depends on the \textit{order} and \textit{uplo} arguments as follows:

\begin{align*}
\text{if } \text{order} &= \text{Nag}_\text{ColMajor} \text{ and } \text{uplo} = \text{Nag}_\text{Upper}, \\
& A_{ij} \text{ is stored in } \text{ap}[((j - 1) \times j/2 + i - 1)], \text{ for } i \leq j; \\
\text{if } \text{order} &= \text{Nag}_\text{ColMajor} \text{ and } \text{uplo} = \text{Nag}_\text{Lower}, \\
& A_{ij} \text{ is stored in } \text{ap}[((2n - j) \times (j - 1)/2 + i - 1)], \text{ for } i \geq j; \\
\text{if } \text{order} &= \text{Nag}_\text{RowMajor} \text{ and } \text{uplo} = \text{Nag}_\text{Upper}, \\
& A_{ij} \text{ is stored in } \text{ap}[((2n - i) \times (i - 1)/2 + j - 1)], \text{ for } i \leq j; \\
\text{if } \text{order} &= \text{Nag}_\text{RowMajor} \text{ and } \text{uplo} = \text{Nag}_\text{Lower}, \\
& A_{ij} \text{ is stored in } \text{ap}[((i - 1) \times i/2 + j - 1)], \text{ for } i \geq j.
\end{align*}

\textit{On exit:} the contents of \( \text{ap} \) are destroyed.

8: \( \text{bp}[\text{dim}] \) – Complex

\textit{Input/Output}

\textit{Note:} the dimension, \( \text{dim} \), of the array \( \text{bp} \) must be at least \( \max(1, n \times (n + 1)/2) \).

\textit{On entry:} the upper or lower triangle of the \( n \) by \( n \) Hermitian matrix \( B \), packed by rows or columns.

The storage of elements \( B_{ij} \) depends on the \textit{order} and \textit{uplo} arguments as follows:

\begin{align*}
\text{if } \text{order} &= \text{Nag}_\text{ColMajor} \text{ and } \text{uplo} = \text{Nag}_\text{Upper}, \\
& B_{ij} \text{ is stored in } \text{bp}[((j - 1) \times j/2 + i - 1)], \text{ for } i \leq j; \\
\text{if } \text{order} &= \text{Nag}_\text{ColMajor} \text{ and } \text{uplo} = \text{Nag}_\text{Lower}, \\
& B_{ij} \text{ is stored in } \text{bp}[((2n - j) \times (j - 1)/2 + i - 1)], \text{ for } i \geq j; \\
\text{if } \text{order} &= \text{Nag}_\text{RowMajor} \text{ and } \text{uplo} = \text{Nag}_\text{Upper}, \\
& B_{ij} \text{ is stored in } \text{bp}[((2n - i) \times (i - 1)/2 + j - 1)], \text{ for } i \leq j; \\
\text{if } \text{order} &= \text{Nag}_\text{RowMajor} \text{ and } \text{uplo} = \text{Nag}_\text{Lower}, \\
& B_{ij} \text{ is stored in } \text{bp}[((i - 1) \times i/2 + j - 1)], \text{ for } i \geq j.
\end{align*}

\textit{On exit:} the triangular factor \( U \) or \( L \) from the Cholesky factorization \( B = U^H U \) or \( B = LL^H \), in the same storage format as \( B \).

9: \( \text{vl} \) – double

\textit{Input}

\textit{On entry:} if \( \text{range} = \text{Nag}_\text{Interval} \), the lower and upper bounds of the interval to be searched for eigenvalues.

\text{If } \text{range} = \text{Nag}_\text{AllValues} \text{ or } \text{Nag}_\text{Indices}, \text{vl} \text{ and } \text{vu} \text{ are not referenced.}

\textit{Constraint:} if \( \text{range} = \text{Nag}_\text{Interval} \), \( \text{vl} < \text{vu} \).

10: \( \text{vu} \) – double

\textit{Input}

\textit{On entry:} if \( \text{range} = \text{Nag}_\text{Interval} \), the lower and upper bounds of the interval to be searched for eigenvalues.

\text{If } \text{range} = \text{Nag}_\text{AllValues} \text{ or } \text{Nag}_\text{Interval}, \text{vl} \text{ and } \text{vu} \text{ are not referenced.}

11: \( \text{il} \) – Integer

\textit{Input}

\textit{On entry:} if \( \text{range} = \text{Nag}_\text{Indices} \), the indices (in ascending order) of the smallest and largest eigenvalues to be returned.

\text{If } \text{range} = \text{Nag}_\text{AllValues} \text{ or } \text{Nag}_\text{Interval}, \text{il} \text{ and } \text{iu} \text{ are not referenced.}

12: \( \text{iu} \) – Integer

\textit{Input}

\textit{On entry:} if \( \text{range} = \text{Nag}_\text{Indices} \), the indices (in ascending order) of the smallest and largest eigenvalues to be returned.

\text{If } \text{range} = \text{Nag}_\text{AllValues} \text{ or } \text{Nag}_\text{Interval}, \text{il} \text{ and } \text{iu} \text{ are not referenced.}
Constraints:
if range = Nag_Indices and n = 0, il = 1 and iu = 0;
if range = Nag_Indices and n > 0, 1 ≤ il ≤ iu ≤ n.

13: abstol – double

\textit{Input}
\textit{On entry}: the absolute error tolerance for the eigenvalues. An approximate eigenvalue is accepted as converged when it is determined to lie in an interval \([a, b]\) of width less than or equal to
\[\text{abstol} + \epsilon \max(\|a\|, \|b\|),\]
where \(\epsilon\) is the \textit{machine precision}. If \text{abstol} is less than or equal to zero, then \(\text{abstol} + \epsilon \|T\|_1\) will be used in its place, where \(T\) is the tridiagonal matrix obtained by reducing \(C\) to tridiagonal form. Eigenvalues will be computed most accurately when \text{abstol} is set to twice the underflow threshold \(2 \times \text{nag_real_safe_small_number( )}\), not zero. If this function returns with \text{fail} = \text{NE_CONVERGENCE}, indicating that some eigenvectors did not converge, try setting \text{abstol} to \(2 \times \text{nag_real_safe_small_number( )}\). See Demmel and Kahan (1990).

14: m – Integer *

\textit{Output}
\textit{On exit}: the total number of eigenvalues found. 0 ≤ m ≤ n.
If range = Nag_AllValues, m = n.
If range = Nag_Indices, m = iu - il + 1.

15: w[n] – double

\textit{Output}
\textit{On exit}: the first m elements contain the selected eigenvalues in ascending order.

16: z[dim] – Complex

\textit{Output}
\textit{Note}: the dimension, \text{dim}, of the array \(z\) must be at least
\[
\max(1, \text{pdz} \times n) \text{ when } \text{job} = \text{Nag_DoBoth};
1 \text{ otherwise.}
\]
The \((i,j)\)th element of the matrix \(Z\) is stored in
\[
\begin{align*}
Z[(j - 1) \times \text{pdz} + i - 1] & \text{ when } \text{order} = \text{Nag_ColMajor}; \\
Z[(i - 1) \times \text{pdz} + j - 1] & \text{ when } \text{order} = \text{Nag_RowMajor}.
\end{align*}
\]
\textit{On exit}: if \text{job} = \text{Nag_DoBoth}, then
if \text{fail} = \text{NE_NOERROR}, the first m columns of \(Z\) contain the orthonormal eigenvectors of the matrix \(A\) corresponding to the selected eigenvalues, with the \(i\)th column of \(Z\) holding the eigenvector associated with \(w[i - 1]\). The eigenvectors are normalized as follows:
\[
\begin{align*}
\text{if } \text{itype} = 1 \text{ or } 2, \ Z^\text{H} B Z = I; \\
\text{if } \text{itype} = 3, \ Z^\text{H} B^{-1} Z = I;
\end{align*}
\]
if an eigenvector fails to converge (\text{fail} = \text{NE_CONVERGENCE}), then that column of \(Z\) contains the latest approximation to the eigenvector, and the index of the eigenvector is returned in \text{jfail}.
If \text{job} = \text{Nag_EigVals}, \(z\) is not referenced.

17: pdz – Integer

\textit{Input}
\textit{On entry}: the stride separating row or column elements (depending on the value of \text{order}) in the array \(z\).
Constraints:
if \( \text{job} = \text{Nag}_\text{DoBoth} \), \( \text{pdz} \geq \text{max}(1, \text{n}) \); otherwise \( \text{pdz} \geq 1 \).

18: \( \text{jfail}[\text{dim}] \) – Integer

Note: the dimension, \( \text{dim} \), of the array \( \text{jfail} \) must be at least \( \text{max}(1, \text{n}) \).

On exit: if \( \text{job} = \text{Nag}_\text{DoBoth} \), then
if \( \text{fail}.\text{code} = \text{NE}_\text{NOERROR} \), the first \( m \) elements of \( \text{jfail} \) are zero;
if \( \text{fail}.\text{code} = \text{NE}_\text{CONVERGENCE} \), \( \text{jfail} \) contains the indices of the eigenvectors that failed to converge.
If \( \text{job} = \text{Nag}_\text{EigVals} \), \( \text{jfail} \) is not referenced.

19: \( \text{fail} \) – NagError *

The NAG error argument (see Section 3.6 in the Essential Introduction).

6 Error Indicators and Warnings

\textbf{NE\_ALLOC\_FAIL}
Dynamic memory allocation failed.
See Section 3.2.1.2 in the Essential Introduction for further information.

\textbf{NE\_BAD\_PARAM}
On entry, argument \( \langle \text{value} \rangle \) had an illegal value.

\textbf{NE\_CONVERGENCE}
The algorithm failed to converge; \( \langle \text{value} \rangle \) eigenvectors failed to converge.

\textbf{NE\_ENUM\_INT\_2}
On entry, \( \text{job} = \langle \text{value} \rangle \), \( \text{pdz} = \langle \text{value} \rangle \) and \( \text{n} = \langle \text{value} \rangle \).
Constraint: if \( \text{job} = \text{Nag}_\text{DoBoth} \), \( \text{pdz} \geq \text{max}(1, \text{n}) \);
otherwise \( \text{pdz} \geq 1 \).

\textbf{NE\_ENUM\_INT\_3}
On entry, \( \text{range} = \langle \text{value} \rangle \), \( \text{il} = \langle \text{value} \rangle \), \( \text{iu} = \langle \text{value} \rangle \) and \( \text{n} = \langle \text{value} \rangle \).
Constraint: if \( \text{range} = \text{Nag}_\text{Indices} \) and \( \text{n} = 0 \), \( \text{il} = 1 \) and \( \text{iu} = 0 \);
if \( \text{range} = \text{Nag}_\text{Indices} \) and \( \text{n} > 0 \), \( 1 \leq \text{il} \leq \text{iu} \leq \text{n} \).

\textbf{NE\_ENUM\_REAL\_2}
On entry, \( \text{range} = \langle \text{value} \rangle \), \( \text{vl} = \langle \text{value} \rangle \) and \( \text{vu} = \langle \text{value} \rangle \).
Constraint: if \( \text{range} = \text{Nag}_\text{Interval} \), \( \text{vl} < \text{vu} \).

\textbf{NE\_INT}
On entry, \( \text{itype} = \langle \text{value} \rangle \).
Constraint: \( \text{itype} = 1, 2 \) or \( 3 \).
On entry, \( \text{n} = \langle \text{value} \rangle \).
Constraint: \( \text{n} \geq 0 \).
On entry, \( \text{pdz} = \langle \text{value} \rangle \).
Constraint: \( \text{pdz} > 0 \).
An internal error has occurred in this function. Check the function call and any array sizes. If the call is correct then please contact NAG for assistance.

An unexpected error has been triggered by this function. Please contact NAG.
See Section 3.6.6 in the Essential Introduction for further information.

If fail.errnum = n + \langle value \rangle, for 1 \leq \langle value \rangle \leq n, then the leading minor of order \langle value \rangle of B is not positive definite. The factorization of B could not be completed and no eigenvalues or eigenvectors were computed.

Your licence key may have expired or may not have been installed correctly.
See Section 3.6.5 in the Essential Introduction for further information.

If B is ill-conditioned with respect to inversion, then the error bounds for the computed eigenvalues and vectors may be large, although when the diagonal elements of B differ widely in magnitude the eigenvalues and eigenvectors may be less sensitive than the condition of B would suggest. See Section 4.10 of Anderson et al. (1999) for details of the error bounds.

nag_zhpgvx (f08tpc) is threaded by NAG for parallel execution in multithreaded implementations of the NAG Library.

nag_zhpgvx (f08tpc) makes calls to BLAS and/or LAPACK routines, which may be threaded within the vendor library used by this implementation. Consult the documentation for the vendor library for further information.

Please consult the X06 Chapter Introduction for information on how to control and interrogate the OpenMP environment used within this function. Please also consult the Users’ Note for your implementation for any additional implementation-specific information.

The total number of floating-point operations is proportional to \( n^3 \).
The real analogue of this function is nag_dspgvx (f08tbc).

This example finds the eigenvalues in the half-open interval \((-3, 3]\), and corresponding eigenvectors, of the generalized Hermitian eigenproblem \( Az = \lambda Bz \), where

\[
A = \begin{pmatrix}
-7.36 & 0.77 - 0.43i & -0.64 - 0.92i & 3.01 - 6.97i \\
0.77 + 0.43i & 3.49 & 2.19 + 4.45i & 1.90 + 3.73i \\
-0.64 + 0.92i & 2.19 - 4.45i & 0.12 & 2.88 - 3.17i \\
3.01 + 6.97i & 1.90 - 3.73i & 2.88 + 3.17i & -2.54
\end{pmatrix}
\]

and

\[
B = \begin{pmatrix}
3.23 & 1.51 - 1.92i & 1.90 + 0.84i & 0.42 + 2.50i \\
1.51 + 1.92i & 3.58 & -0.23 + 1.11i & -1.18 + 1.37i \\
1.90 - 0.84i & -0.23 - 1.11i & 4.09 & 2.33 - 0.14i \\
0.42 - 2.50i & -1.18 - 1.37i & 2.33 + 0.14i & 4.29
\end{pmatrix}
\]
The example program for nag_zhpgvd (f08tqc) illustrates solving a generalized symmetric eigenproblem of the form $AB\mathbf{z} = \lambda \mathbf{z}$.
