NAG Library Function Document

nag_zhbgst (f08usc)

1 Purpose

nag_zhbgst (f08usc) reduces a complex Hermitian-definite generalized eigenproblem $Az = \lambda Bz$ to the standard form $Cy = \lambda y$, where $A$ and $B$ are band matrices, $A$ is a complex Hermitian matrix, and $B$ has been factorized by nag_zpbstf (f08utc).

2 Specification

```c
#include <nag.h>
#include <nagf08.h>

void nag_zhbgst (Nag_OrderType order, Nag_VectType vect, Nag_UploType uplo,
                 Integer n, Integer ka, Integer kb, Complex ab[], Integer pdab,
                 const Complex bb[], Integer pdbb, Complex x[], Integer pdx,
                 NagError *fail)
```

3 Description

To reduce the complex Hermitian-definite generalized eigenproblem $Az = \lambda Bz$ to the standard form $Cy = \lambda y$, where $A$, $B$ and $C$ are banded, nag_zhbgst (f08usc) must be preceded by a call to nag_zpbstf (f08utc) which computes the split Cholesky factorization of the positive definite matrix $B$: $B = S^H S$. The split Cholesky factorization, compared with the ordinary Cholesky factorization, allows the work to be approximately halved.

This function overwrites $A$ with $C = X^HAX$, where $X = S^{-1} Q$ and $Q$ is a unitary matrix chosen (implicitly) to preserve the bandwidth of $A$. The function also has an option to allow the accumulation of $X$, and then, if $z$ is an eigenvector of $C$, $Xz$ is an eigenvector of the original system.

4 References

5 Arguments

1:  
   **order**  – Nag_OrderType  
   **Input**  
   On entry: the order argument specifies the two-dimensional storage scheme being used, i.e., row-maj or column-major ordering. C language defined storage is specified by order = Nag_RowMajor. See Section 3.2.1.3 in the Essential Introduction for a more detailed explanation of the use of this argument.  
   Constraint: order = Nag_RowMajor or Nag_ColMajor.

2:  
   **vect**  – Nag_VectType  
   **Input**  
   On entry: indicates whether $X$ is to be returned.  
   vect = Nag_DoNotForm  
   $X$ is not returned.

Mark 25
\text{vect} = \text{Nag\_FormX}

\text{X} \text{ is returned.}

\text{Constraint: vect} = \text{Nag\_DoNotForm or Nag\_FormX.}

3: \text{uplo} – \text{Nag\_UploType} \hspace{1cm} \text{Input}

\text{On entry: indicates whether the upper or lower triangular part of } A \text{ is stored.}

\text{uplo} = \text{Nag\_Upper}

The upper triangular part of \( A \) is stored.

\text{uplo} = \text{Nag\_Lower}

The lower triangular part of \( A \) is stored.

\text{Constraint: uplo} = \text{Nag\_Upper or Nag\_Lower.}

4: \text{n} – \text{Integer} \hspace{1cm} \text{Input}

\text{On entry: } n, \text{ the order of the matrices } A \text{ and } B.

\text{Constraint: } n \geq 0.

5: \text{ka} – \text{Integer} \hspace{1cm} \text{Input}

\text{On entry: if uplo} = \text{Nag\_Upper, the number of superdiagonals, } k_a, \text{ of the matrix } A.

\text{If uplo} = \text{Nag\_Lower, the number of subdiagonals, } k_a, \text{ of the matrix } A.

\text{Constraint: } ka \geq 0.

6: \text{kb} – \text{Integer} \hspace{1cm} \text{Input}

\text{On entry: if uplo} = \text{Nag\_Upper, the number of superdiagonals, } k_b, \text{ of the matrix } B.

\text{If uplo} = \text{Nag\_Lower, the number of subdiagonals, } k_b, \text{ of the matrix } B.

\text{Constraint: } ka \geq kb \geq 0.

7: \text{ab}[\text{dim}] – \text{Complex} \hspace{1cm} \text{Input/Output}

\text{Note: the dimension, dim, of the array ab must be at least } \max(1,\text{pdab} \times n).

\text{On entry: the upper or lower triangle of the } n \text{ by } n \text{ Hermitian band matrix } A.

This is stored as a notional two-dimensional array with row elements or column elements stored contiguously. The storage of elements of \( A_{ij} \), depends on the order and uplo arguments as follows:

\begin{align*}
\text{if order} &= \text{Nag\_ColMajor and uplo} = \text{Nag\_Upper,} \\
&\quad \text{\( A_{ij} \) is stored in } ab[k_a + i - j + (j - 1) \times \text{pdab}], \text{ for } j = 1, \ldots, n \text{ and } i = \max(1, j - k_a), \ldots, j; \\
\text{if order} &= \text{Nag\_ColMajor and uplo} = \text{Nag\_Lower,} \\
&\quad \text{\( A_{ij} \) is stored in } ab[i - j + (j - 1) \times \text{pdab}], \text{ for } j = 1, \ldots, n \text{ and } i = j, \ldots, \min(n, j + k_a); \\
\text{if order} &= \text{Nag\_RowMajor and uplo} = \text{Nag\_Upper,} \\
&\quad \text{\( A_{ij} \) is stored in } ab[j - i + (i - 1) \times \text{pdab}], \text{ for } i = 1, \ldots, n \text{ and } j = i, \ldots, \min(n, i + k_a); \\
\text{if order} &= \text{Nag\_RowMajor and uplo} = \text{Nag\_Lower,} \\
&\quad \text{\( A_{ij} \) is stored in } ab[k_a + j - i + (i - 1) \times \text{pdab}], \text{ for } i = 1, \ldots, n \text{ and } j = \max(1, i - k_a), \ldots, i.
\end{align*}

\text{On exit: the upper or lower triangle of } ab \text{ is overwritten by the corresponding upper or lower triangle of } C \text{ as specified by uplo.}
8:  **pdab** – Integer  
    *Input*
    
    *On entry:* the stride separating row or column elements (depending on the value of *order*) of the matrix *A* in the array *ab*.
    
    *Constraint:* \( \text{pdab} \geq \text{ka} + 1 \).

9:  **bb[**dim]**] – const Complex  
    *Input*
    
    *Note:* the dimension, *dim*, of the array *bb* must be at least \( \max(1, \text{pdbb} \times \text{n}) \).
    
    *On entry:* the banded split Cholesky factor of *B* as specified by *uplo*, *n* and \( \text{kb} \) and returned by nag_zpbstf (f08utc).

10: **pdbb** – Integer  
    *Input*
    
    *On entry:* the stride separating row or column elements (depending on the value of *order*) of the matrix in the array *bb*.
    
    *Constraint:* \( \text{pdbb} \geq \text{kb} + 1 \).

11: **x[**dim]**] – Complex  
    *Output*
    
    *Note:* the dimension, *dim*, of the array *x* must be at least \( \max(1, \text{pdx} \times \text{n}) \) when *vect* = Nag_FormX; 
    1 when *vect* = Nag_DoNotForm.
    
    The \((i, j)\)th element of the matrix *X* is stored in
    
    \( x[(j - 1) \times \text{pdx} + i - 1] \) when *order* = Nag_ColMajor;
    \( x[(i - 1) \times \text{pdx} + j - 1] \) when *order* = Nag_RowMajor.
    
    *On exit:* the *n* by *n* matrix *X* = *S*\(^{-1}\)*Q, if *vect* = Nag_FormX.
    
    If *vect* = Nag_DoNotForm, *x* is not referenced.

12: **pdx** – Integer  
    *Input*
    
    *On entry:* the stride separating row or column elements (depending on the value of *order*) in the array *x*.
    
    *Constraints:*
    
    - if *vect* = Nag_FormX, \( \text{pdx} \geq \max(1, \text{n}) \);
    - if *vect* = Nag_DoNotForm, \( \text{pdx} \geq 1 \).

13: **fail** – NagError *  
    *Input/Output*
    
    The NAG error argument (see Section 3.6 in the Essential Introduction).

### 6 Error Indicators and Warnings

**NE_ALLOC_FAIL**

Dynamic memory allocation failed.

See Section 3.2.1.2 in the Essential Introduction for further information.

**NE_BAD_PARAM**

On entry, argument \(<\text{value}>\) had an illegal value.

**NE_ENUM_INT_2**

On entry, *vect* = \(<\text{value}>\), \( \text{pdx} = \langle\text{value}\rangle \) and \( \text{n} = \langle\text{value}\rangle \).

*Constraint:* if *vect* = Nag_FormX, \( \text{pdx} \geq \max(1, \text{n}) \);
if *vect* = Nag_DoNotForm, \( \text{pdx} \geq 1 \).
NE_INT
On entry, \(ka = \langle value\rangle\).
Constraint: \(ka \geq 0\).

On entry, \(n = \langle value\rangle\).
Constraint: \(n \geq 0\).

On entry, \(pdab = \langle value\rangle\).
Constraint: \(pdab > 0\).

On entry, \(pdbb = \langle value\rangle\).
Constraint: \(pdbb > 0\).

On entry, \(pdx = \langle value\rangle\).
Constraint: \(pdx > 0\).

NE_INT_2
On entry, \(ka = \langle value\rangle\) and \(kb = \langle value\rangle\).
Constraint: \(ka \geq kb \geq 0\).

On entry, \(pdab = \langle value\rangle\) and \(ka = \langle value\rangle\).
Constraint: \(pdab \geq ka + 1\).

On entry, \(pdbb = \langle value\rangle\) and \(kb = \langle value\rangle\).
Constraint: \(pdbb \geq kb + 1\).

NE_INTERNAL_ERROR
An internal error has occurred in this function. Check the function call and any array sizes. If the
call is correct then please contact NAG for assistance.

An unexpected error has been triggered by this function. Please contact NAG.
See Section 3.6.6 in the Essential Introduction for further information.

NE_NO_LICENCE
Your licence key may have expired or may not have been installed correctly.
See Section 3.6.5 in the Essential Introduction for further information.

7 Accuracy
Forming the reduced matrix \(C\) is a stable procedure. However it involves implicit multiplication by \(B^{-1}\).
When nag_zhbgst (f08usc) is used as a step in the computation of eigenvalues and eigenvectors of the
original problem, there may be a significant loss of accuracy if \(B\) is ill-conditioned with respect to
inversion.

8 Parallelism and Performance
nag_zhbgst (f08usc) is not threaded by NAG in any implementation.

nag_zhbgst (f08usc) makes calls to BLAS and/or LAPACK routines, which may be threaded within the
vendor library used by this implementation. Consult the documentation for the vendor library for further
information.

Please consult the X06 Chapter Introduction for information on how to control and interrogate the
OpenMP environment used within this function. Please also consult the Users’ Note for your
implementation for any additional implementation-specific information.
9 Further Comments

The total number of real floating-point operations is approximately $20n^2k_B$, when vect = Nag_DoNotForm, assuming $n \gg k_A, k_B$; there are an additional $5n^3(k_B/k_A)$ operations when vect = Nag_FormX.

The real analogue of this function is nag_dsbgst (f08uec).

10 Example

This example computes all the eigenvalues of $A z = \lambda B z$, where

$$A = \begin{pmatrix}
-1.13 + 0.00i & 1.94 - 2.10i & -1.40 + 0.25i & 0.00 + 0.00i \\
1.94 + 2.10i & -1.91 + 0.00i & -0.82 - 0.89i & -0.67 + 0.34i \\
-1.40 - 0.25i & -0.82 + 0.89i & -1.87 + 0.00i & -1.10 - 0.16i \\
0.00 + 0.00i & -0.67 - 0.34i & -1.10 + 0.16i & 0.50 + 0.00i
\end{pmatrix}$$

and

$$B = \begin{pmatrix}
9.89 + 0.00i & 1.08 - 1.73i & 0.00 + 0.00i & 0.00 + 0.00i \\
1.08 + 1.73i & 1.69 + 0.00i & -0.04 + 0.29i & 0.00 + 0.00i \\
0.00 + 0.00i & -0.04 - 0.29i & 2.65 + 0.00i & -0.33 + 2.24i \\
0.00 + 0.00i & 0.00 + 0.00i & -0.33 - 2.24i & 2.17 + 0.00i
\end{pmatrix}.$$

Here $A$ is Hermitian, $B$ is Hermitian positive definite, and $A$ and $B$ are treated as band matrices. $B$ must first be factorized by nag_zpbstf (f08utc). The program calls nag_zhbgst (f08usc) to reduce the problem to the standard form $C y = \lambda y$, then nag_zhbtrd (f08hsc) to reduce $C$ to tridiagonal form, and nag_dsterf (f08jfc) to compute the eigenvalues.
