NAG Library Function Document
nag_superlu_refine_lu (f11mhc)

1 Purpose
nag_superlu_refine_lu (f11mhc) returns error bounds for the solution of a real sparse system of linear equations with multiple right-hand sides, \( AX = B \) or \( A^T X = B \). It improves the solution by iterative refinement in standard precision, in order to reduce the backward error as much as possible.

2 Specification

```c
#include <nag.h>
#include <nagf11.h>

void nag_superlu_refine_lu (Nag_OrderType order, Nag_TransType trans,
    Integer n, const Integer icolzp[], const Integer irowix[],
    const double a[], const Integer iprm[], const Integer il[],
    const double lval[], const Integer iu[], const double uval[],
    Integer nrhs, const double b[], Integer pdb, double x[], Integer pdx,
    double ferr[], double berr[], NagError *fail)
```

3 Description
nag_superlu_refine_lu (f11mhc) returns the backward errors and estimated bounds on the forward errors for the solution of a real system of linear equations with multiple right-hand sides \( AX = B \) or \( A^T X = B \). The function handles each right-hand side vector (stored as a column of the matrix \( B \)) independently, so we describe the function of nag_superlu_refine_lu (f11mhc) in terms of a single right-hand side \( b \) and solution \( x \).

Given a computed solution \( x \), the function computes the \textit{component-wise backward error} \( \beta \). This is the size of the smallest relative perturbation in each element of \( A \) and \( b \) such that if \( x \) is the exact solution of a perturbed system:

\[
(A + \delta A)x = b + \delta b
\]

then \( |\delta a_{ij}| \leq \beta |a_{ij}| \) and \( |\delta b_i| \leq \beta |b_i| \).

Then the function estimates a bound for the \textit{component-wise forward error} in the computed solution, defined by:

\[
\max_i |x_i - \hat{x}_i| / \max_i |x_i|
\]

where \( \hat{x} \) is the true solution.

The function uses the \textit{LU} factorization \( P_i A P_i = LU \) computed by nag_superlu_lu_factorize (f11mec) and the solution computed by nag_superlu_solve_lu (f11mfc).

4 References

5 Arguments

1: \( \text{order} \) – Nag_OrderType
    
    \textit{Input}
    
    \textit{On entry:} the \text{order} argument specifies the two-dimensional storage scheme being used, i.e., row-major ordering or column-major ordering. C language defined storage is specified by

Mark 25
\textbf{order} = \texttt{Nag_RowMajor}. See Section 3.2.1.3 in the Essential Introduction for a more detailed explanation of the use of this argument.

\textit{Constraint: order} = \texttt{Nag_RowMajor} or \texttt{Nag_ColMajor}.

2: \texttt{trans} – \texttt{Nag_TransType}

\textit{Input}

\textit{On entry:} specifies whether $AX = B$ or $A^TX = B$ is solved.

\texttt{trans} = \texttt{Nag_NoTrans} \quad AX = B \text{ is solved.}

\texttt{trans} = \texttt{Nag_Tran} \quad A^TX = B \text{ is solved.}

\textit{Constraint:} \texttt{trans} = \texttt{Nag_NoTrans} or \texttt{Nag_Tran}.

3: \texttt{n} – \texttt{Integer}

\textit{Input}

\textit{On entry:} $n$, the order of the matrix $A$.

\textit{Constraint:} $n \geq 0$.

4: \texttt{icolzp}[\texttt{dim}] – const \texttt{Integer}

\textit{Input}

\textit{Note:} the dimension, \texttt{dim}, of the array \texttt{icolzp} must be at least $n + 1$.

\textit{On entry:} \texttt{icolzp}[i - 1] contains the index in $A$ of the start of a new column. See Section 2.1.3 in the f11 Chapter Introduction.

5: \texttt{irowix}[\texttt{dim}] – const \texttt{Integer}

\textit{Input}

\textit{Note:} the dimension, \texttt{dim}, of the array \texttt{irowix} must be at least $\texttt{icolzp}[n] - 1$, the number of nonzeros of the sparse matrix $A$.

\textit{On entry:} the row index array of sparse matrix $A$.

6: \texttt{a}[\texttt{dim}] – const \texttt{double}

\textit{Input}

\textit{Note:} the dimension, \texttt{dim}, of the array \texttt{a} must be at least $\texttt{icolzp}[n] - 1$, the number of nonzeros of the sparse matrix $A$.

\textit{On entry:} the array of nonzero values in the sparse matrix $A$.

7: \texttt{iprm}[7 \times n] – const \texttt{Integer}

\textit{Input}

\textit{On entry:} the column permutation which defines $P_c$, the row permutation which defines $P_r$, plus associated data structures as computed by \texttt{nag_superlu_lu_factorize (f11mec)}.

8: \texttt{il}[\texttt{dim}] – const \texttt{Integer}

\textit{Input}

\textit{Note:} the dimension, \texttt{dim}, of the array \texttt{il} must be at least as large as the dimension of the array of the same name in \texttt{nag_superlu_lu_factorize (f11mec)}.

\textit{On entry:} records the sparsity pattern of matrix $L$ as computed by \texttt{nag_superlu_lu_factorize (f11mec)}.

9: \texttt{lval}[\texttt{dim}] – const \texttt{double}

\textit{Input}

\textit{Note:} the dimension, \texttt{dim}, of the array \texttt{lval} must be at least as large as the dimension of the array of the same name in \texttt{nag_superlu_lu_factorize (f11mec)}.

\textit{On entry:} records the nonzero values of matrix $L$ and some nonzero values of matrix $U$ as computed by \texttt{nag_superlu_lu_factorize (f11mec)}.
10: \( \text{iu}[\dim] \rightarrow \text{const Integer} \quad \text{Input} \)

**Note:** the dimension, \( \dim \), of the array \( \text{iu} \) must be at least as large as the dimension of the array of the same name in \text{nag_superlu_lu_factorize} (f11mec).

**On entry:** records the sparsity pattern of matrix \( U \) as computed by \text{nag_superlu_lu_factorize} (f11mec).

11: \( \text{uval}[\dim] \rightarrow \text{const double} \quad \text{Input} \)

**Note:** the dimension, \( \dim \), of the array \( \text{uval} \) must be at least as large as the dimension of the array of the same name in \text{nag_superlu_lu_factorize} (f11mec).

**On entry:** records some nonzero values of matrix \( U \) as computed by \text{nag_superlu_lu_factorize} (f11mec).

12: \( \text{nrhs} \rightarrow \text{Integer} \quad \text{Input} \)

**On entry:** \( \text{nrhs} \), the number of right-hand sides in \( B \).

**Constraint:** \( \text{nrhs} \geq 0 \).

13: \( \text{b}[\dim] \rightarrow \text{const double} \quad \text{Input} \)

**Note:** the dimension, \( \dim \), of the array \( \text{b} \) must be at least
\[
\max(1, \text{pdb} \times \text{nrhs}) \quad \text{when} \quad \text{order} = \text{Nag\_ColMajor};
\]
\[
\max(1, \text{n} \times \text{pdb}) \quad \text{when} \quad \text{order} = \text{Nag\_RowMajor}.
\]

The \((i, j)\)th element of the matrix \( B \) is stored in
\[
\text{b}[(j - 1) \times \text{pdb} + i - 1] \quad \text{when} \quad \text{order} = \text{Nag\_ColMajor};
\]
\[
\text{b}[(i - 1) \times \text{pdb} + j - 1] \quad \text{when} \quad \text{order} = \text{Nag\_RowMajor}.
\]

**On entry:** the \( n \) by \( \text{nrhs} \) right-hand side matrix \( B \).

14: \( \text{pdb} \rightarrow \text{Integer} \quad \text{Input} \)

**On entry:** the stride separating row or column elements (depending on the value of \text{order}) in the array \( \text{b} \).

**Constraints:**
\[
\begin{align*}
\text{if} \quad \text{order} = \text{Nag\_ColMajor}, \quad \text{pdb} \geq \max(1, \text{n}); \\
\text{if} \quad \text{order} = \text{Nag\_RowMajor}, \quad \text{pdb} \geq \max(1, \text{nrhs}).
\end{align*}
\]

15: \( \text{x}[\dim] \rightarrow \text{double} \quad \text{Input/Output} \)

**Note:** the dimension, \( \dim \), of the array \( \text{x} \) must be at least
\[
\max(1, \text{pdb} \times \text{nrhs}) \quad \text{when} \quad \text{order} = \text{Nag\_ColMajor};
\]
\[
\max(1, \text{n} \times \text{pdb}) \quad \text{when} \quad \text{order} = \text{Nag\_RowMajor}.
\]

The \((i, j)\)th element of the matrix \( X \) is stored in
\[
\text{x}[(j - 1) \times \text{pdb} + i - 1] \quad \text{when} \quad \text{order} = \text{Nag\_ColMajor};
\]
\[
\text{x}[(i - 1) \times \text{pdb} + j - 1] \quad \text{when} \quad \text{order} = \text{Nag\_RowMajor}.
\]

**On entry:** the \( n \) by \( \text{nrhs} \) solution matrix \( X \), as returned by \text{nag_superlu_solve_lu} (f11mfc).

**On exit:** the \( n \) by \( \text{nrhs} \) improved solution matrix \( X \).

16: \( \text{pdx} \rightarrow \text{Integer} \quad \text{Input} \)

**On entry:** the stride separating row or column elements (depending on the value of \text{order}) in the array \( \text{x} \).
Constraints:

if order = Nag.ColMajor, pdx \geq \max(1, n);
if order = Nag.RowMajor, pdx \geq \max(1, nrhs).

17: ferr[nrhs] – double  
Output

On exit: ferr[j - 1] contains an estimated error bound for the jth solution vector, that is, the jth column of X, for j = 1, 2, ..., nrhs.

18: berr[nrhs] – double  
Output

On exit: berr[j - 1] contains the component-wise backward error bound \beta for the jth solution vector, that is, the jth column of X, for j = 1, 2, ..., nrhs.

19: fail – NagError *  
Input/Output

The NAG error argument (see Section 3.6 in the Essential Introduction).

6 Error Indicators and Warnings

NE_ALLOC_FAIL
Dynamic memory allocation failed.
See Section 3.2.1.2 in the Essential Introduction for further information.

NE_BAD_PARAM
On entry, argument (value) had an illegal value.

NE_INT
On entry, n = (value).
Constraint: n \geq 0.

On entry, nrhs = (value).
Constraint: nrhs \geq 0.

On entry, pdb = (value).
Constraint: pdb > 0.

On entry, pdx = (value).
Constraint: pdx > 0.

NE_INT_2
On entry, pdb = (value) and n = (value).
Constraint: pdb \geq \max(1, n).

On entry, pdb = (value) and nrhs = (value).
Constraint: pdb \geq \max(1, nrhs).

On entry, pdx = (value) and n = (value).
Constraint: pdx \geq \max(1, n).

On entry, pdx = (value) and nrhs = (value).
Constraint: pdx \geq \max(1, nrhs).

NE_INTERNAL_ERROR
An internal error has occurred in this function. Check the function call and any array sizes. If the call is correct then please contact NAG for assistance.

An unexpected error has been triggered by this function. Please contact NAG.
See Section 3.6.6 in the Essential Introduction for further information.
NE_INVALID_PERM_COL
Incorrect column permutations in array iprm.

NE_INVALID_PERM_ROW
Incorrect Row Permutations in array iprm.

NE_NO_LICENCE
Your licence key may have expired or may not have been installed correctly. See Section 3.6.5 in the Essential Introduction for further information.

7 Accuracy
The bounds returned in ferr are not rigorous, because they are estimated, not computed exactly; but in practice they almost always overestimate the actual error.

8 Parallelism and Performance
nag_superlu_refine_lu (f11mhc) is threaded by NAG for parallel execution in multithreaded implementations of the NAG Library.
nag_superlu_refine_lu (f11mhc) makes calls to BLAS and/or LAPACK routines, which may be threaded within the vendor library used by this implementation. Consult the documentation for the vendor library for further information.
Please consult the X06 Chapter Introduction for information on how to control and interrogate the OpenMP environment used within this function. Please also consult the Users’ Note for your implementation for any additional implementation-specific information.

9 Further Comments
At most five steps of iterative refinement are performed, but usually only one or two steps are required.

Estimating the forward error involves solving a number of systems of linear equations of the form $Ax = b$ or $A^T x = b$;

10 Example
This example solves the system of equations $AX = B$ using iterative refinement and to compute the forward and backward error bounds, where

$$
A = \begin{pmatrix}
2.00 & 1.00 & 0 & 0 & 0 \\
0 & 0 & 1.00 & -1.00 & 0 \\
4.00 & 0 & 1.00 & 0 & 1.00 \\
0 & 0 & 0 & 1.00 & 2.00 \\
0 & -2.00 & 0 & 0 & 3.00
\end{pmatrix}
$$

and

$$
B = \begin{pmatrix}
1.56 & 3.12 \\
-0.25 & -0.50 \\
3.60 & 7.20 \\
1.33 & 2.66 \\
0.52 & 1.04
\end{pmatrix}
$$

Here $A$ is nonsymmetric and must first be factorized by nag_superlu_lu_factorize (f11mec).
