NAG Library Function Document

nag_rand_hypergeometric (g05tec)

1 Purpose
nag_rand_hypergeometric (g05tec) generates a vector of pseudorandom integers from the discrete hypergeometric distribution of the number of specified items in a sample of size \( l \), taken from a population of size \( k \) with \( m \) specified items in it.

2 Specification
#include <nag.h>
#include <nagg05.h>

void nag_rand_hypergeometric (Nag_ModeRNG mode, Integer n, Integer ns, Integer np, Integer m, double r[], Integer lr, Integer state[], Integer x[], NagError *fail)

3 Description
nag_rand_hypergeometric (g05tec) generates \( n \) integers \( x_i \) from a discrete hypergeometric distribution, where the probability of \( x_i = I \) is

\[
P(i = I) = \frac{l!m!(k-l)!(k-m)!}{I!(l-I)!(m-I)!(k-m-l+I)!k!} \quad \text{if} \quad I = \max(0, m + l - k), \ldots, \min(l, m),
\]

\[
P(i = I) = 0 \quad \text{otherwise}.
\]

The variates can be generated with or without using a search table and index. If a search table is used then it is stored with the index in a reference vector and subsequent calls to nag_rand_hypergeometric (g05tec) with the same parameter values can then use this reference vector to generate further variates. The reference array is generated by a recurrence relation if \( lm/\sqrt{k} < 50k^3 \), otherwise Stirling’s approximation is used.

One of the initialization functions nag_rand_init_repeatable (g05kfc) (for a repeatable sequence if computed sequentially) or nag_rand_init_nonrepeatable (g05kgc) (for a non-repeatable sequence) must be called prior to the first call to nag_rand_hypergeometric (g05tec).

4 References

5 Arguments
1: mode – Nag_ModeRNG
   \( \text{Input} \)
   On entry: a code for selecting the operation to be performed by the function.

   mode = Nag.InitializeReference
   Set up reference vector only.

   mode = Nag.GenerateFromReference
   Generate variates using reference vector set up in a prior call to nag_rand_hypergeometric (g05tec).

   mode = Nag.InitializeAndGenerate
   Set up reference vector and generate variates.
mode = Nag_GenerateWithoutReference
    Generate variates without using the reference vector.

Constraint: mode = Nag_InitializeReference, Nag_GenerateFromReference, Nag_InitializeAndGenerate or Nag_GenerateWithoutReference.

2: n – Integer
    Input
    On entry: n, the number of pseudorandom numbers to be generated.
    Constraint: n ≥ 0.

3: ns – Integer
    Input
    On entry: l, the sample size of the hypergeometric distribution.
    Constraint: 0 ≤ ns ≤ np.

4: np – Integer
    Input
    On entry: k, the population size of the hypergeometric distribution.
    Constraint: np ≥ 0.

5: m – Integer
    Input
    On entry: m, the number of specified items of the hypergeometric distribution.
    Constraint: 0 ≤ m ≤ np.

6: r[lr] – double
    Communication Array
    On entry: if mode = Nag_GenerateFromReference, the reference vector from the previous call to nag_rand_hypergeometric (g05tec).
    If mode = Nag_GenerateWithoutReference, r is not referenced and may be NULL.
    On exit: if mode ≠ Nag_GenerateWithoutReference, the reference vector.

7: lr – Integer
    Input
    On entry: the dimension of the array r.
    Suggested value:
    if mode ≠ Nag_GenerateWithoutReference,
        lr = 28 + 20 × √(ns × m × (np − m) × (np − ns))/np3 approximately;
    otherwise lr = 1.
    Constraints:
    if mode = Nag_InitializeReference or Nag_InitializeAndGenerate, lr must not be too small, but the limit is too complicated to specify;
    if mode = Nag_GenerateFromReference, lr must remain unchanged from the previous call to nag_rand_hypergeometric (g05tec).

8: state[dim] – Integer
    Communication Array
    Note: the dimension, dim, of this array is dictated by the requirements of associated functions that must have been previously called. This array MUST be the same array passed as argument state in the previous call to nag_rand_init_repeatable (g05kfc) or nag_rand_init_nonrepeatable (g05kge).
    On entry: contains information on the selected base generator and its current state.
    On exit: contains updated information on the state of the generator.
9: \( x[n] \) – Integer

Output

On exit: the pseudorandom numbers from the specified hypergeometric distribution.

10: fail – NagError

Input/Output

The NAG error argument (see Section 3.6 in the Essential Introduction).

6 Error Indicators and Warnings

NE_ALLOC_FAIL

Dynamic memory allocation failed.

See Section 3.2.1.2 in the Essential Introduction for further information.

NE_BAD_PARAM

On entry, argument \( \text{value} \) had an illegal value.

NE_INT

On entry, \( l \) is too small when \( \text{mode} = \text{Nag}_\text{InitializeReference} \) or \( \text{Nag}_\text{InitializeAndGenerate} \):

\[ l = |\text{value}|, \text{minimum length required} = |\text{value}|. \]

On entry, \( n = |\text{value}|. \)
Constraint: \( n \geq 0. \)

On entry, \( np = |\text{value}|. \)
Constraint: \( np \geq 0. \)

NE_INT_2

On entry, \( m = |\text{value}| \) and \( np = |\text{value}|. \)
Constraint: \( 0 \leq m \leq np. \)

On entry, \( ns = |\text{value}| \) and \( np = |\text{value}|. \)
Constraint: \( 0 \leq ns \leq np. \)

NE_INTERNAL_ERROR

An internal error has occurred in this function. Check the function call and any array sizes. If the call is correct then please contact NAG for assistance.

An unexpected error has been triggered by this function. Please contact NAG.
See Section 3.6.6 in the Essential Introduction for further information.

NE_INVALID_STATE

On entry, \( \text{state} \) vector has been corrupted or not initialized.

NE_NO_LICENCE

Your licence key may have expired or may not have been installed correctly.
See Section 3.6.5 in the Essential Introduction for further information.

NE_PREV_CALL

The value of \( ns, np \) or \( m \) is not the same as when \( r \) was set up in a previous call with \( \text{mode} = \text{Nag}_\text{InitializeReference} \) or \( \text{Nag}_\text{InitializeAndGenerate} \).

NE_REF_VEC

On entry, some of the elements of the array \( r \) have been corrupted or have not been initialized.
7    Accuracy

Not applicable.

8    Parallelism and Performance

nag_rand_hypergeometric (g05tec) is threaded by NAG for parallel execution in multithreaded implementations of the NAG Library.

Please consult the X06 Chapter Introduction for information on how to control and interrogate the OpenMP environment used within this function. Please also consult the Users’ Note for your implementation for any additional implementation-specific information.

9    Further Comments

None.

10   Example

The example program prints 20 pseudorandom integers from a hypergeometric distribution with $l = 500$, $m = 900$ and $n = 1000$, generated by a single call to nag_rand_hypergeometric (g05tec), after initialization by nag_rand_init_repeatable (g05kfc).
