1 Purpose

nag_complex_log_gamma (s14agc) returns the value of the logarithm of the gamma function \( \ln \Gamma(z) \) for complex \( z \).

2 Specification

```c
#include <nag.h>
#include <nags.h>

Complex nag_complex_log_gamma (Complex z, NagError *fail)
```

3 Description

nag_complex_log_gamma (s14agc) evaluates an approximation to the logarithm of the gamma function \( \ln \Gamma(z) \) defined for \( \text{Re}(z) > 0 \) by

\[
\ln \Gamma(z) = \ln \int_0^\infty e^{-t} t^{z-1} dt
\]

where \( z = x + iy \) is complex. It is extended to the rest of the complex plane by analytic continuation unless \( y = 0 \), in which case \( z \) is real and each of the points \( z = 0, -1, -2, \ldots \) is a singularity and a branch point.

nag_complex_log_gamma (s14agc) is based on the method proposed by Köhlig (1972) in which the value of \( \ln \Gamma(z) \) is computed in the different regions of the \( z \) plane by means of the formulae

\[
\ln \Gamma(z) = \left( z - \frac{1}{2} \right) \ln z - z + \frac{1}{2} \ln 2\pi + \sum_{k=1}^{K} \frac{B_{2k}}{2k(2k-1)} z^{-2k} + R_K(z)
\]

if \( x \geq x_0 \geq 0 \),

\[
= \ln \Gamma(z+n) - \ln \prod_{\nu=0}^{n-1} (z+\nu)
\]

if \( x_0 > x \geq 0 \),

\[
= \ln \pi - \ln \Gamma(1-z) - \ln(\sin \pi z)
\]

if \( x < 0 \),

where \( n = [x_0] - [x] \), \( \{B_{2k}\} \) are Bernoulli numbers (see Abramowitz and Stegun (1972)) and \( [x] \) is the largest integer \( \leq x \). Note that care is taken to ensure that the imaginary part is computed correctly, and not merely modulo \( 2\pi \).

The function uses the values \( K = 10 \) and \( x_0 = 7 \). The remainder term \( R_K(z) \) is discussed in Section 7. To obtain the value of \( \ln \Gamma(z) \) when \( z \) is real and positive, nag_log_gamma (s14abc) can be used.

4 References

Köhlig K S (1972) Programs for computing the logarithm of the gamma function, and the digamma function, for complex arguments Comp. Phys. Comm. 4 221–226
5 Arguments

1:  \( z \) – Complex  
   \( \quad \text{Input} \)
   \( \text{On entry:} \) the argument \( z \) of the function.
   \( \text{Constraint:} \ z.re \text{ must not be ‘too close’ (see Section 6) to a non-positive integer when } z.im = 0.0. \)

2:  \( \text{fail} \) – NagError *  
   \( \quad \text{Input/Output} \)
   The NAG error argument (see Section 3.6 in the Essential Introduction).

6 Error Indicators and Warnings

\textbf{NE_ALLOC_FAIL}
Dynamic memory allocation failed.
See Section 3.2.1.2 in the Essential Introduction for further information.

\textbf{NE_INTERNAL_ERROR}
An internal error has occurred in this function. Check the function call and any array sizes. If the call is correct then please contact NAG for assistance.

An unexpected error has been triggered by this function. Please contact NAG.
See Section 3.6.6 in the Essential Introduction for further information.

\textbf{NE_NO_LICENCE}
Your licence key may have expired or may not have been installed correctly.
See Section 3.6.5 in the Essential Introduction for further information.

\textbf{NE_TOO_CLOSE_INTEGER}
On entry, \( z.re \) is ‘too close’ to a non-positive integer when \( z.im = 0.0: z.re = \langle \text{value} \rangle \), \( \text{nint}(z.re) = \langle \text{value} \rangle \).

7 Accuracy

The remainder term \( R_K(z) \) satisfies the following error bound:

\[
|R_K(z)| \leq \frac{|B_{2K}|}{|2K - 1|} x^{1 - 2K}
\leq \frac{|B_{2K}|}{|2K - 1|} x^{1 - 2K} \text{if } x \geq 0.
\]

Thus \( |R_{10}(7)| < 2.5 \times 10^{-15} \) and hence in theory the function is capable of achieving an accuracy of approximately 15 significant digits.

8 Parallelism and Performance

Not applicable.

9 Further Comments

None.
10 Example

This example evaluates the logarithm of the gamma function \( \ln \Gamma(z) \) at \( z = -1.5 + 2.5i \), and prints the results.

10.1 Program Text

```c
/* nag_complex_log_gamma (s14agc) Example Program.
 */

#include <nag.h>
#include <stdio.h>
#include <nag_stdlib.h>
#include <nags.h>

int main(void)
{
    Integer exit_status = 0;
    Complex y, z;
    NagError fail;

    INIT_FAIL(fail);

    /* Skip heading in data file */
    #ifdef _WIN32
        scanf_s("%*[\n]");
    #else
        scanf("%*[\n]");
    #endif
    printf("nag_complex_log_gamma (s14agc) Example Program Results\n");
    printf(" z ln(Gamma(z))\n");
    #ifdef _WIN32
        while (scanf_s(" (%lf,%lf)%*[\n]", &z.re, &z.im) != EOF)
    #else
        while (scanf(" (%lf,%lf)%*[\n]", &z.re, &z.im) != EOF)
    #endif
    {
        /* nag_complex_log_gamma (s14agc).
         * Logarithm of the Gamma function \ln \Gamma(z) 
         */
        y = nag_complex_log_gamma(z, &fail);
        if (fail.code == NE_NOERROR)
            printf("(%5.1f,%5.1f) (%13.4e,%13.4e)\n", z.re, z.im, y.re, y.im);
        else
            printf("Error from nag_complex_log_gamma (s14agc).\n", fail.message);
        exit_status = 1;
        goto END;
    }

END:

    return exit_status;
}
```
