NAG Library Function Document

nag_airy_ai_vector (s17auc)

1 Purpose

nag_airy_ai_vector (s17auc) returns an array of values for the Airy function, \( \text{Ai}(x) \).

2 Specification

```c
#include <nag.h>
#include <nags.h>

void nag_airy_ai_vector (Integer n, const double x[], double f[],
                        Integer ivalid[], NagError *fail)
```

3 Description

nag_airy_ai_vector (s17auc) evaluates an approximation to the Airy function, \( \text{Ai}(x) \), for an array of arguments \( x_i \), for \( i = 1, 2, \ldots, n \). It is based on a number of Chebyshev expansions:

- For \( x < -5 \),
  \[
  \text{Ai}(x) = \frac{a(t) \sin z - b(t) \cos z}{(-x)^{1/4}}
  \]
  where \( z = \frac{\pi}{4} + \frac{2}{3} \sqrt{-x^3} \), and \( a(t) \) and \( b(t) \) are expansions in the variable \( t = -2 \left(\frac{s}{x}\right)^3 - 1 \).

- For \(-5 \leq x \leq 0\),
  \[
  \text{Ai}(x) = f(t) - xg(t),
  \]
  where \( f \) and \( g \) are expansions in \( t = -2 \left(\frac{s}{x}\right)^3 - 1 \).

- For \( 0 < x < 4.5 \),
  \[
  \text{Ai}(x) = e^{-3s/2} y(t),
  \]
  where \( y \) is an expansion in \( t = 4s/9 - 1 \).

- For \( 4.5 \leq x < 9 \),
  \[
  \text{Ai}(x) = e^{-5s/2} u(t),
  \]
  where \( u \) is an expansion in \( t = 4s/9 - 3 \).

- For \( x \geq 9 \),
  \[
  \text{Ai}(x) = \frac{e^{-z} v(t)}{x^{1/4}},
  \]
  where \( z = \frac{2}{3} \sqrt{3} \) and \( v \) is an expansion in \( t = 2 \left(\frac{18}{s^2}\right) - 1 \).

For \( |x| < \text{machine precision} \), the result is set directly to \( \text{Ai}(0) \). This both saves time and guards against underflow in intermediate calculations.
For large negative arguments, it becomes impossible to calculate the phase of the oscillatory function with any precision and so the function must fail. This occurs if $x < -\left(\frac{3}{2\epsilon}\right)^{2/3}$, where $\epsilon$ is the machine precision.

For large positive arguments, where $Ai$ decays in an essentially exponential manner, there is a danger of underflow so the function must fail.

4 References

5 Arguments

1: $n$ – Integer

On entry: $n$, the number of points.

Constraint: $n \geq 0$.

2: $x[n]$ – const double

On entry: the argument $x_i$ of the function, for $i = 1, 2, \ldots, n$.

3: $f[n]$ – double

On exit: $Ai(x_i)$, the function values.

4: $ivalid[n]$ – Integer

On exit: $ivalid[i - 1]$ contains the error code for $x_i$, for $i = 1, 2, \ldots, n$.

$ivalid[i - 1] = 0$

No error.

$ivalid[i - 1] = 1$

$x_i$ is too large and positive. $f[i - 1]$ contains zero. The threshold value is the same as for

fail.code = NE_REAL_ARG_GT in nag_airy_ai (s17agc), as defined in the Users’ Note for your implementation.

$ivalid[i - 1] = 2$

$x_i$ is too large and negative. $f[i - 1]$ contains zero. The threshold value is the same as for

fail.code = NE_REAL_ARG_LT in nag_airy_ai (s17agc), as defined in the Users’ Note for your implementation.

5: fail – NagError *

The NAG error argument (see Section 3.6 in the Essential Introduction).

6 Error Indicators and Warnings

NE_ALLOC_FAIL

Dynamic memory allocation failed.

See Section 3.2.1.2 in the Essential Introduction for further information.

NE_BAD_PARAM

On entry, argument $<$value$>$ had an illegal value.
On entry, \( n = \langle \text{value} \rangle \).
Constraint: \( n \geq 0 \).

**NE_INTERNAL_ERROR**

An internal error has occurred in this function. Check the function call and any array sizes. If the call is correct then please contact NAG for assistance.

An unexpected error has been triggered by this function. Please contact NAG. See Section 3.6.6 in the Essential Introduction for further information.

**NE_NO_LICENCE**

Your licence key may have expired or may not have been installed correctly. See Section 3.6.5 in the Essential Introduction for further information.

**NW_INVALID**

On entry, at least one value of \( x \) was invalid. Check \( \text{invalid} \) for more information.

### 7 Accuracy

For negative arguments the function is oscillatory and hence absolute error is the appropriate measure. In the positive region the function is essentially exponential-like and here relative error is appropriate. The absolute error, \( E \), and the relative error, \( \epsilon \), are related in principle to the relative error in the argument, \( \delta \), by

\[
E \simeq |xAi'(x)|\delta, \quad \epsilon \simeq \left| \frac{xAi'(x)}{Ai(x)} \right| \delta.
\]

In practice, approximate equality is the best that can be expected. When \( \delta, \epsilon \) or \( E \) is of the order of the machine precision, the errors in the result will be somewhat larger.

For small \( x \), errors are strongly damped by the function and hence will be bounded by the machine precision.

For moderate negative \( x \), the error behaviour is oscillatory but the amplitude of the error grows like

\[
\text{amplitude} \left( \frac{E}{\delta} \right) \sim |x|^{5/4} \sqrt{\pi}.
\]

However the phase error will be growing roughly like \( \frac{2}{3} \sqrt{|x|^{3}} \) and hence all accuracy will be lost for large negative arguments due to the impossibility of calculating \( \sin \) and \( \cos \) to any accuracy if \( \frac{2}{3} \sqrt{|x|^{3}} > \frac{1}{\delta} \).

For large positive arguments, the relative error amplification is considerable:

\[
\frac{\epsilon}{\delta} \sim \sqrt{|x|^{3}}.
\]

This means a loss of roughly two decimal places accuracy for arguments in the region of 20. However very large arguments are not possible due to the danger of setting underflow and so the errors are limited in practice.

### 8 Parallelism and Performance

Not applicable.
9 Further Comments
None.

10 Example
This example reads values of $x$ from a file, evaluates the function at each value of $x_i$ and prints the results.
