NAG Library Function Document

nag_bessel_k0_vector (s18aqc)

1 Purpose

nag_bessel_k0_vector (s18aqc) returns an array of values of the modified Bessel function \( K_0(x) \).

2 Specification

#include <nag.h>
#include <nags.h>

void nag_bessel_k0_vector (Integer n, const double x[], double f[],
Integer ivalid[], NagError *fail)

3 Description

nag_bessel_k0_vector (s18aqc) evaluates an approximation to the modified Bessel function of the second kind \( K_0(x_i) \) for an array of arguments \( x_i \), for \( i = 1, 2, \ldots, n \).

Note: \( K_0(x) \) is undefined for \( x \leq 0 \) and the function will fail for such arguments.

The function is based on five Chebyshev expansions:

For \( 0 < x \leq 1 \),
\[
K_0(x) = -\ln x \sum_{r=0} a_r T_r(t) + \sum_{r=0} b_r T_r(t), \quad \text{where} \quad t = 2x^2 - 1.
\]

For \( 1 < x \leq 2 \),
\[
K_0(x) = e^{-x} \sum_{r=0} c_r T_r(t), \quad \text{where} \quad t = 2x - 3.
\]

For \( 2 < x \leq 4 \),
\[
K_0(x) = e^{-x} \sum_{r=0} d_r T_r(t), \quad \text{where} \quad t = x - 3.
\]

For \( x > 4 \),
\[
K_0(x) = \frac{e^{-x}}{\sqrt{x}} \sum_{r=0} e_r T_r(t), \quad \text{where} \quad t = \frac{9 - x}{1 + x}.
\]

For \( x \) near zero, \( K_0(x) \approx -\gamma - \ln\left(\frac{x}{2}\right) \), where \( \gamma \) denotes Euler’s constant. This approximation is used when \( x \) is sufficiently small for the result to be correct to machine precision.

For large \( x \), where there is a danger of underflow due to the smallness of \( K_0 \), the result is set exactly to zero.

4 References

5 Arguments

1: \( n \) – Integer \( \text{Input} \)
   
   On entry: \( n \), the number of points.
   
   Constraint: \( n \geq 0 \).

2: \( x[n] \) – const double \( \text{Input} \)
   
   On entry: the argument \( x_i \) of the function, for \( i = 1,2,\ldots,n \).
   
   Constraint: \( x[i - 1] > 0.0 \), for \( i = 1,2,\ldots,n \).

3: \( f[n] \) – double \( \text{Output} \)
   
   On exit: \( K_0(x_i) \), the function values.

4: \( invalid[n] \) – Integer \( \text{Output} \)
   
   On exit: \( invalid[i - 1] \) contains the error code for \( x_i \), for \( i = 1,2,\ldots,n \).
   
   \( invalid[i - 1] = 0 \)
   
   No error.
   
   \( invalid[i - 1] = 1 \)
   
   \( x_i \leq 0.0, \ K_0(x_i) \) is undefined. \( f[i - 1] \) contains 0.0.

5: \( fail \) – NagError * \( \text{Input/Output} \)
   
   The NAG error argument (see Section 3.6 in the Essential Introduction).

6 Error Indicators and Warnings

**NE_ALLOC_FAIL**

Dynamic memory allocation failed.

See Section 3.2.1.2 in the Essential Introduction for further information.

**NE_BAD_PARAM**

On entry, argument \( \langle \text{value} \rangle \) had an illegal value.

**NE_INT**

On entry, \( n = \langle \text{value} \rangle \).

Constraint: \( n \geq 0 \).

**NE_INTERNAL_ERROR**

An internal error has occurred in this function. Check the function call and any array sizes. If the call is correct then please contact NAG for assistance.

An unexpected error has been triggered by this function. Please contact NAG.

See Section 3.6.6 in the Essential Introduction for further information.

**NE_NO_LICENCE**

Your licence key may have expired or may not have been installed correctly.

See Section 3.6.5 in the Essential Introduction for further information.

**NW_INVALID**

On entry, at least one value of \( x \) was invalid.

Check \( invalid \) for more information.
7 Accuracy
Let $\delta$ and $\epsilon$ be the relative errors in the argument and result respectively.

If $\delta$ is somewhat larger than the machine precision (i.e., if $\delta$ is due to data errors etc.), then $\epsilon$ and $\delta$ are approximately related by:

$$\epsilon \approx \frac{|xK_1(x)|}{K_0(x)} \delta.$$ 

Figure 1 shows the behaviour of the error amplification factor

$$\frac{|xK_1(x)|}{K_0(x)}.$$ 

However, if $\delta$ is of the same order as machine precision, then rounding errors could make $\epsilon$ slightly larger than the above relation predicts.

For small $x$, the amplification factor is approximately $\left| \frac{1}{\ln x} \right|$, which implies strong attenuation of the error, but in general $\epsilon$ can never be less than the machine precision.

For large $x$, $\epsilon \approx x\delta$ and we have strong amplification of the relative error. Eventually $K_0$, which is asymptotically given by $\frac{e^{-x}}{\sqrt{x}}$, becomes so small that it cannot be calculated without underflow and hence the function will return zero. Note that for large $x$ the errors will be dominated by those of the standard function $\exp$.

![Figure 1](image)

8 Parallelism and Performance
Not applicable.

9 Further Comments
None.
10 Example

This example reads values of $x$ from a file, evaluates the function at each value of $x_i$ and prints the results.
