1 Purpose

nag_kelvin_ber_vector (s19anc) returns an array of values for the Kelvin function ber \( x \).

2 Specification

```c
#include <nag.h>
#include <nags.h>

void nag_kelvin_ber_vector (Integer n, const double x[], double f[],
        Integer ivalid[], NagError *fail)
```

3 Description

nag_kelvin_ber_vector (s19anc) evaluates an approximation to the Kelvin function ber \( x_i \) for an array of arguments \( x_i \), for \( i = 1, 2, \ldots, n \).

Note: ber\((-x) = ber\,x\), so the approximation need only consider \( x \geq 0.0 \).

The function is based on several Chebyshev expansions:

For \( 0 \leq x \leq 5 \),

\[
\text{ber } x = \sum_{r=0}^{\infty} a_r T_r(t), \quad \text{with } t = 2 \left(\frac{x}{5}\right)^4 - 1.
\]

For \( x > 5 \),

\[
\text{ber } x = \frac{e^{x/\sqrt{2}}}{\sqrt{2\pi x}} \left[ \left(1 + \frac{1}{x} a(t)\right) \cos \alpha + \frac{1}{x} b(t) \sin \alpha \right] \\
+ \frac{e^{-x/\sqrt{2}}}{\sqrt{2\pi x}} \left[ \left(1 + \frac{1}{x} c(t)\right) \sin \beta + \frac{1}{x} d(t) \cos \beta \right],
\]

where \( \alpha = \frac{x}{\sqrt{2}} - \frac{\pi}{8}, \beta = \frac{x}{\sqrt{2}} + \frac{\pi}{8}, \)

and \( a(t), b(t), c(t), \) and \( d(t) \) are expansions in the variable \( t = \frac{10}{x} - 1 \).

When \( x \) is sufficiently close to zero, the result is set directly to \( \text{ber} 0 = 1.0 \).

For large \( x \), there is a danger of the result being totally inaccurate, as the error amplification factor grows in an essentially exponential manner; therefore the function must fail.

4 References

5 Arguments

1: \( n \) – Integer

Input

On entry: \( n \), the number of points.

Constraint: \( n \geq 0 \).
2: \( x[n] \) – const double  
\( \text{Input} \)  
\( \text{On entry:} \) the argument \( x_i \) of the function, for \( i = 1, 2, \ldots, n \).

3: \( f[n] \) – double  
\( \text{Output} \)  
\( \text{On exit:} \) ber \( x_i \), the function values.

4: \( \text{ivalid}[n] \) – Integer  
\( \text{Output} \)  
\( \text{On exit:} \) \( \text{ivalid}[i - 1] \) contains the error code for \( x_i \), for \( i = 1, 2, \ldots, n \).

\( \text{ivalid}[i - 1] = 0 \)  
No error.

\( \text{ivalid}[i - 1] = 1 \)  
\( \text{abs}(x_i) \) is too large for an accurate result to be returned. \( f[i - 1] \) contains zero. The threshold value is the same as for \( \text{fail.code} = \text{NE_REAL_ARG_GT} \) in \( \text{nag_kelvin_ber} \) (s19aac), as defined in the Users’ Note for your implementation.

5: \( \text{fail} \) – NagError *  
\( \text{Input/Output} \)  
The NAG error argument (see Section 3.6 in the Essential Introduction).

6  \textbf{Error Indicators and Warnings}

\textbf{NE_ALLOC_FAIL}  
Dynamic memory allocation failed.  
See Section 3.2.1.2 in the Essential Introduction for further information.

\textbf{NE_BAD_PARAM}  
On entry, argument \( \langle \text{value} \rangle \) had an illegal value.

\textbf{NE_INT}  
On entry, \( n = \langle \text{value} \rangle \).  
Constraint: \( n \geq 0 \).

\textbf{NE_INTERNAL_ERROR}  
An internal error has occurred in this function. Check the function call and any array sizes. If the call is correct then please contact NAG for assistance.  
An unexpected error has been triggered by this function. Please contact NAG.  
See Section 3.6.6 in the Essential Introduction for further information.

\textbf{NE_NO_LICENCE}  
Your licence key may have expired or may not have been installed correctly.  
See Section 3.6.5 in the Essential Introduction for further information.

\textbf{NW_IVALID}  
On entry, at least one value of \( x \) was invalid.  
Check \( \text{ivalid} \) for more information.

7  \textbf{Accuracy}

Since the function is oscillatory, the absolute error rather than the relative error is important. Let \( E \) be the absolute error in the result and \( \delta \) be the relative error in the argument. If \( \delta \) is somewhat larger than the \textit{machine precision}, then we have:
\[ E \approx \left| \frac{x}{\sqrt{2}} (\text{ber}_1 x + \text{bei}_1 x) \right| \delta \]

(provided \( E \) is within machine bounds).

For small \( x \) the error amplification is insignificant and thus the absolute error is effectively bounded by the machine precision.

For medium and large \( x \), the error behaviour is oscillatory and its amplitude grows like \( \sqrt{x e^x / \sqrt{2}} \).

Therefore it is not possible to calculate the function with any accuracy when \( \sqrt{x e^x / \sqrt{2}} > \frac{\sqrt{2\pi}}{8} \). Note that this value of \( x \) is much smaller than the minimum value of \( x \) for which the function overflows.

8 Parallelism and Performance

Not applicable.

9 Further Comments

None.

10 Example

This example reads values of \( x \) from a file, evaluates the function at each value of \( x_i \) and prints the results.
