1 Purpose

nag_elliptic_integral_E (s21bfc) returns a value of the classical (Legendre) form of the incomplete elliptic integral of the second kind.

2 Specification

```c
#include <nag.h>
#include <nags.h>

double nag_elliptic_integral_E (double phi, double dm, NagError *fail)
```

3 Description

nag_elliptic_integral_E (s21bfc) calculates an approximation to the integral

\[
E(\phi \mid m) = \int_0^\phi (1 - m \sin^2 \theta)^{\frac{1}{2}} d\theta,
\]

where \(0 \leq \phi \leq \frac{\pi}{2}\) and \(m \sin^2 \phi \leq 1\).

The integral is computed using the symmetrised elliptic integrals of Carlson (Carlson (1979) and Carlson (1988)). The relevant identity is

\[
E(\phi \mid m) = \sin \phi R_F(q, r, 1) - \frac{1}{3} m \sin^3 \phi R_D(q, r, 1),
\]

where \(q = \cos^2 \phi, r = 1 - m \sin^2 \phi, R_F\) is the Carlson symmetrised incomplete elliptic integral of the first kind (see nag_elliptic_integral_rf (s21bbc)) and \(R_D\) is the Carlson symmetrised incomplete elliptic integral of the second kind (see nag_elliptic_integral_rd (s21bcc)).

4 References

5 Arguments

1: `phi` – double
   `Input`

2: `dm` – double
   `Input`

   *On entry:* the arguments \(\phi\) and \(m\) of the function.

   *Constraints:*

   \(0.0 \leq \phi \leq \frac{\pi}{2};\)

   \(dm \times \sin^2(\phi) \leq 1.0.\)

3: `fail` – NagError *
   `Input/Output`

   *The NAG error argument (see Section 3.6 in the Essential Introduction).*
6 Error Indicators and Warnings

**NE_ALLOC_FAIL**
Dynamic memory allocation failed.
See Section 3.2.1.2 in the Essential Introduction for further information.

**NE_INTERNAL_ERROR**
An internal error has occurred in this function. Check the function call and any array sizes. If the call is correct then please contact NAG for assistance.
An unexpected error has been triggered by this function. Please contact NAG.
See Section 3.6.6 in the Essential Introduction for further information.

**NE_NO_LICENCE**
Your licence key may have expired or may not have been installed correctly.
See Section 3.6.5 in the Essential Introduction for further information.

**NE_REAL**
On entry, $\phi = \langle value \rangle$.
Constraint: $0 \leq \phi \leq \frac{\pi}{2}$.

**NE_REAL_2**
On entry, $\phi = \langle value \rangle$ and $dm = \langle value \rangle$; the integral is undefined.
Constraint: $dm \times \sin^2(\phi) \leq 1.0$.

7 Accuracy
In principle nag_elliptic_integral_E (s21bfc) is capable of producing full machine precision. However round-off errors in internal arithmetic will result in slight loss of accuracy. This loss should never be excessive as the algorithm does not involve any significant amplification of round-off error. It is reasonable to assume that the result is accurate to within a small multiple of the machine precision.

8 Parallelism and Performance
Not applicable.

9 Further Comments
You should consult the s Chapter Introduction, which shows the relationship between this function and the Carlson definitions of the elliptic integrals. In particular, the relationship between the argument-constraints for both forms becomes clear.

For more information on the algorithms used to compute $R_F$ and $R_D$, see the function documents for nag_elliptic_integral_rf (s21bbc) and nag_elliptic_integral_rd (s21bcc), respectively.

If you wish to input a value of $\phi$ outside the range allowed by this function you should refer to Section 17.4 of Abramowitz and Stegun (1972) for useful identities. For example, $E(-\phi|m) = -E(\phi|m)$. A parameter $m > 1$ can be replaced by one less than unity using $E(\phi|m) = \sqrt{m}E(\phi\sqrt{m}\frac{1}{m}) - (m - 1)\phi$.

10 Example
This example simply generates a small set of nonextreme arguments that are used with the function to produce the table of results.
