NAG Library Function Document

nag_binary_aon_price (s30ccc)

1 Purpose

nag_binary_aon_price (s30ccc) computes the price of a binary or digital asset-or-nothing option.

2 Specification

#include <nag.h>
#include <nags.h>

void nag_binary_aon_price (Nag_OrderType order, Nag_CallPut option,
 Integer m, Integer n, const double x[], double s, const double t[],
 double sigma, double r, double q, double p[], NagError *fail)

3 Description

nag_binary_aon_price (s30ccc) computes the price of a binary or digital asset-or-nothing option which pays the underlying asset itself, \( S \), at expiration if the option is in-the-money (see Section 2.4 in the s Chapter Introduction). For a strike price, \( X \), underlying asset price, \( S \), and time to expiry, \( T \), the payoff is therefore \( S \), if \( S > X \) for a call or \( S < X \) for a put. Nothing is paid out when this condition is not met.

The price of a call with volatility, \( \sigma \), risk-free interest rate, \( r \), and annualised dividend yield, \( q \), is

\[
P_{\text{call}} = S e^{-qT} \Phi(d_1)
\]

and for a put,

\[
P_{\text{put}} = S e^{-qT} \Phi(-d_1)
\]

where \( \Phi \) is the cumulative Normal distribution function,

\[
\Phi(x) = \frac{1}{\sqrt{2\pi}} \int_{-\infty}^{x} \exp(-y^2/2)dy,
\]

and

\[
d_1 = \ln(S/X) + (r - q + \sigma^2/2)T / \sigma\sqrt{T}.
\]

The option price \( P_{ij} = P(X = X_i, T = T_j) \) is computed for each strike price in a set \( X_i \), \( i = 1, 2, \ldots, m \), and for each expiry time in a set \( T_j \), \( j = 1, 2, \ldots, n \).

5 Arguments

1: order – Nag_OrderType  

Input

On entry: the order argument specifies the two-dimensional storage scheme being used, i.e., row-major ordering or column-major ordering. C language defined storage is specified by order = Nag_RowMajor. See Section 3.2.1.3 in the Essential Introduction for a more detailed explanation of the use of this argument.

Constraint: order = Nag_RowMajor or Nag_ColMajor.
2: **option** – Nag_CallPut  
*Input*

*On entry:* determines whether the option is a call or a put.

**option** = Nag_Call  
A call; the holder has a right to buy.

**option** = Nag_Put  
A put; the holder has a right to sell.

**Constraint:** **option** = Nag_Call or Nag_Put.

3: **m** – Integer  
*Input*

*On entry:* the number of strike prices to be used.

**Constraint:** **m** ≥ 1.

4: **n** – Integer  
*Input*

*On entry:* the number of times to expiry to be used.

**Constraint:** **n** ≥ 1.

5: **x[m]** – const double  
*Input*

*On entry:* **x[i − 1]** must contain \(X_i\), the \(i\)th strike price, for \(i = 1, 2, \ldots, m\).

**Constraint:** \(x[i − 1] ≥ z\) and \(x[i − 1] ≤ 1/z\), where \(z = \text{nag\_real\_safe\_small\_number}\), the safe range parameter, for \(i = 1, 2, \ldots, m\).

6: **s** – double  
*Input*

*On entry:* \(S\), the price of the underlying asset.

**Constraint:** **s** ≥ \(z\) and **s** ≤ \(1.0/z\), where **s** = nag_real_safe_small_number, the safe range parameter.

7: **t[n]** – const double  
*Input*

*On entry:* **t[i − 1]** must contain \(T_i\), the \(i\)th time, in years, to expiry, for \(i = 1, 2, \ldots, n\).

**Constraint:** \(t[i − 1] ≥ z\), where **t** = nag_real_safe_small_number, the safe range parameter, for \(i = 1, 2, \ldots, n\).

8: **sigma** – double  
*Input*

*On entry:* \(\sigma\), the volatility of the underlying asset. Note that a rate of 15% should be entered as 0.15.

**Constraint:** **sigma** > 0.0.

9: **r** – double  
*Input*

*On entry:* \(r\), the annual risk-free interest rate, continuously compounded. Note that a rate of 5% should be entered as 0.05.

**Constraint:** **r** ≥ 0.0.

10: **q** – double  
*Input*

*On entry:* \(q\), the annual continuous yield rate. Note that a rate of 8% should be entered as 0.08.

**Constraint:** **q** ≥ 0.0.
11: \( p[m \times n] \) – double

**Output**

*Note:* where \( P(i,j) \) appears in this document, it refers to the array element

\[
p[(j - 1) \times m + i - 1] \quad \text{when} \quad \text{order} = \text{Nag\_ColMajor};
\]

\[
p[(i - 1) \times n + j - 1] \quad \text{when} \quad \text{order} = \text{Nag\_RowMajor}.
\]

*On exit:* \( P(i,j) \) contains \( P_{ij} \), the option price evaluated for the strike price \( x_i \) at expiry \( t_j \) for

\[
i = 1, 2, \ldots, m \quad \text{and} \quad j = 1, 2, \ldots, n.
\]

12: **fail** – NagError *

The NAG error argument (see Section 3.6 in the Essential Introduction).

### 6 Error Indicators and Warnings

**NE_ALLOC_FAIL**

Dynamic memory allocation failed.

See Section 3.2.1.2 in the Essential Introduction for further information.

**NE_BAD_PARAM**

On entry, argument \( \langle\text{value}\rangle \) had an illegal value.

**NE_INT**

On entry, \( m = \langle\text{value}\rangle \).

Constraint: \( m \geq 1 \).

On entry, \( n = \langle\text{value}\rangle \).

Constraint: \( n \geq 1 \).

**NE_INTERNAL_ERROR**

An internal error has occurred in this function. Check the function call and any array sizes. If the call is correct then please contact NAG for assistance.

An unexpected error has been triggered by this function. Please contact NAG.

See Section 3.6.6 in the Essential Introduction for further information.

**NE_NO_LICENCE**

Your licence key may have expired or may not have been installed correctly.

See Section 3.6.5 in the Essential Introduction for further information.

**NE_REAL**

On entry, \( q = \langle\text{value}\rangle \).

Constraint: \( q \geq 0.0 \).

On entry, \( r = \langle\text{value}\rangle \).

Constraint: \( r \geq 0.0 \).

On entry, \( s = \langle\text{value}\rangle \).

Constraint: \( s \geq \langle\text{value}\rangle \) and \( s \leq \langle\text{value}\rangle \).

On entry, \( \sigma = \langle\text{value}\rangle \).

Constraint: \( \sigma > 0.0 \).

**NE_REAL_ARRAY**

On entry, \( t[i] = \langle\text{value}\rangle \).

Constraint: \( t[i] \geq \langle\text{value}\rangle \).
On entry, $x[\text{value}] = \langle\text{value}\rangle$.
Constraint: $x[i] \geq \langle\text{value}\rangle$ and $x[i] \leq \langle\text{value}\rangle$.

7 Accuracy
The accuracy of the output is dependent on the accuracy of the cumulative Normal distribution function, $\Phi$. This is evaluated using a rational Chebyshev expansion, chosen so that the maximum relative error in the expansion is of the order of the machine precision (see nag_cumul_normal (s15abc) and nag_erfc (s15adc)). An accuracy close to machine precision can generally be expected.

8 Parallelism and Performance
nag_binary_aon_price (s30ccc) is threaded by NAG for parallel execution in multithreaded implementations of the NAG Library.

Please consult the X06 Chapter Introduction for information on how to control and interrogate the OpenMP environment used within this function. Please also consult the Users’ Note for your implementation for any additional implementation-specific information.

9 Further Comments
None.

10 Example
This example computes the price of an asset-or-nothing put with a time to expiry of 0.5 years, a stock price of 70 and a strike price of 65. The risk-free interest rate is 7% per year, there is an annual dividend return of 5% and the volatility is 27% per year.
