NAG Library Function Document

nag_amer_bs_price (s30qcc)

1 Purpose

nag_amer_bs_price (s30qcc) computes the Bjerksund and Stensland (2002) approximation to the price of an American option.

2 Specification

```c
#include <nag.h>
#include <nags.h>

void nag_amer_bs_price (Nag_OrderType order, Nag_CallPut option, Integer m, Integer n, const double x[], double s, const double t[], double sigma, double r, double q, double p[], NagError *fail)
```

3 Description

nag_amer_bs_price (s30qcc) computes the price of an American option using the closed form approximation of Bjerksund and Stensland (2002). The time to maturity, \( T \), is divided into two periods, each with a flat early exercise boundary, by choosing a time \( t = \frac{1}{2}(\sqrt{5} - 1)T \). The two boundary values are defined as \( \bar{x} = \bar{X}(t) \), \( \bar{X} = \bar{X}(T) \) with

\[
\bar{X}(\tau) = B_0 + (B_\infty - B_0)(1 - \exp\{h(\tau)\}),
\]

where

\[
h(\tau) = -(b\tau + 2\sigma\sqrt{\tau})\left(\frac{X^2}{(B_\infty - B_0)B_0}\right),
\]

\[
B_\infty \equiv \frac{\beta}{\beta - 1}X, \quad B_0 \equiv \max\left\{X, \left(\frac{r}{r - b}\right)X\right\},
\]

\[
\beta = \left(\frac{1}{2} - \frac{b}{\sigma^2}\right) + \sqrt{\left(\frac{b}{\sigma^2} - \frac{1}{2}\right)^2 + 2\frac{r}{\sigma^2}},
\]

with \( b = r - q \), the cost of carry, where \( r \) is the risk-free interest rate and \( q \) is the annual dividend rate. Here \( X \) is the strike price and \( \sigma \) is the annual volatility.

The price of an American call option is approximated as

\[
P_{\text{call}} = \alpha(\bar{X})S^0 - \alpha(\bar{X})\phi(S,t|\beta,\bar{X},\bar{X}) + \phi(S,t|1,\bar{X},\bar{X}) - \phi(S,t|1,\bar{x},\bar{X}) - X\phi(S,t|0,\bar{X},\bar{X}) + X\phi(S,t|0,\bar{x},\bar{X}) + \alpha(\bar{x})\phi(S,t|\beta,\bar{x},\bar{X}) - \alpha(\bar{x})\Psi(S,T|\beta,\bar{x},\bar{X},\bar{x},t) + \Psi(S,T|1,\bar{x},\bar{X},\bar{x},t) - \Psi(S,T|1,\bar{X},\bar{x},\bar{x},t) - X\Psi(S,T|0,\bar{x},\bar{X},\bar{x},t) + X\Psi(S,T|0,\bar{X},\bar{x},\bar{x},t),
\]

where \( \alpha, \phi \) and \( \Psi \) are as defined in Bjerksund and Stensland (2002).

The price of a put option is obtained by the put-call transformation,

\[
P_{\text{put}}(X, S, T, \sigma, r, q) = P_{\text{call}}(S, X, T, \sigma, q, r).
\]
The option price \( P_{ij} = P(X = X_i, T = T_j) \) is computed for each strike price in a set \( X_i, i = 1, 2, \ldots, m \), and for each expiry time in a set \( T_j, j = 1, 2, \ldots, n \).

4 References

5 Arguments
1: \( \text{order} \) – Nag_OrderType \( \text{Input} \)
   
   \( \text{On entry:} \) the \( \text{order} \) argument specifies the two-dimensional storage scheme being used, i.e., row-major ordering or column-major ordering. C language defined storage is specified by \( \text{order} = \text{Nag_RowMajor} \). See Section 3.2.1.3 in the Essential Introduction for a more detailed explanation of the use of this argument.

   \( \text{Constraint:} \) \( \text{order} = \text{Nag_RowMajor} \) or \( \text{Nag_ColMajor} \).

2: \( \text{option} \) – Nag_CallPut \( \text{Input} \)
   
   \( \text{On entry:} \) determines whether the option is a call or a put.

   \( \text{option} = \text{Nag_Call} \)
   A call; the holder has a right to buy.

   \( \text{option} = \text{Nag_Put} \)
   A put; the holder has a right to sell.

   \( \text{Constraint:} \) \( \text{option} = \text{Nag_Call} \) or \( \text{Nag_Put} \).

3: \( \text{m} \) – Integer \( \text{Input} \)
   
   \( \text{On entry:} \) the number of strike prices to be used.

   \( \text{Constraint:} \) \( \text{m} \geq 1 \).

4: \( \text{n} \) – Integer \( \text{Input} \)
   
   \( \text{On entry:} \) the number of times to expiry to be used.

   \( \text{Constraint:} \) \( \text{n} \geq 1 \).

5: \( \text{x[m]} \) – const double \( \text{Input} \)
   
   \( \text{On entry:} \) \( x[i-1] \) must contain \( X_i \), the \( i \)th strike price, for \( i = 1, 2, \ldots, \text{m} \).

   \( \text{Constraint:} \) \( x[i-1] \geq z \) and \( x[i-1] \leq 1/z \), where \( z = \text{nag_real_safe_small_number} \), the safe range parameter, for \( i = 1, 2, \ldots, \text{m} \).

6: \( \text{s} \) – double \( \text{Input} \)
   
   \( \text{On entry:} \) \( S \), the price of the underlying asset.

   \( \text{Constraint:} \) \( s \geq z \) and \( s \leq 1/z \), where \( z = \text{nag_real_safe_small_number} \), the safe range parameter and \( s^\beta \leq 1/z \) where \( \beta \) is as defined in Section 3.
7: \( t[n] \) – const double  
   \textit{Input}  
   \textit{On entry:} \( t[i-1] \) must contain \( T_i \), the \( i \)th time, in years, to expiry, for \( i = 1, 2, \ldots, n \).  
   \textit{Constraint:} \( t[i-1] \geq z \), where \( z = \text{nag_real_safe_small_number} \), the safe range parameter, for \( i = 1, 2, \ldots, n \).  

8: \( \text{sigma} \) – double  
   \textit{Input}  
   \textit{On entry:} \( \sigma \), the volatility of the underlying asset. Note that a rate of 15% should be entered as 0.15.  
   \textit{Constraint:} \( \text{sigma} > 0.0 \).  

9: \( r \) – double  
   \textit{Input}  
   \textit{On entry:} \( r \), the annual risk-free interest rate, continuously compounded. Note that a rate of 5% should be entered as 0.05.  
   \textit{Constraint:} \( r \geq 0.0 \).  

10: \( q \) – double  
    \textit{Input}  
    \textit{On entry:} \( q \), the annual continuous yield rate. Note that a rate of 8% should be entered as 0.08.  
    \textit{Constraint:} \( q \geq 0.0 \).  

11: \( p[m \times n] \) – double  
    \textit{Output}  
    \textit{Note:} where \( P(i, j) \) appears in this document, it refers to the array element \( p[(j - 1) \times m + i - 1] \) when \( \text{order} = \text{Nag_ColMajor} \); \( p[(i - 1) \times n + j - 1] \) when \( \text{order} = \text{Nag_RowMajor} \).  
    \textit{On exit:} \( P(i, j) \) contains \( P_{ij} \), the option price evaluated for the strike price \( x_i \) at expiry \( t_j \) for \( i = 1, 2, \ldots, m \) and \( j = 1, 2, \ldots, n \).  

12: \( \text{fail} \) – \text{NagError}*  
    \textit{Input/Output}  
    The NAG error argument (see Section 3.6 in the Essential Introduction).  

6 \textbf{Error Indicators and Warnings}  

\textbf{NE_ALLOC_FAIL}  
Dynamic memory allocation failed.  
See Section 3.2.1.2 in the Essential Introduction for further information.  

\textbf{NE_BAD_PARAM}  
On entry, argument \( (\text{value}) \) had an illegal value.  

\textbf{NE_INT}  
On entry, \( m = (\text{value}) \).  
Constraint: \( m \geq 1 \).  
On entry, \( n = (\text{value}) \).  
Constraint: \( n \geq 1 \).  

\textbf{NE_INTERNAL_ERROR}  
An internal error has occurred in this function. Check the function call and any array sizes. If the call is correct then please contact NAG for assistance.
An unexpected error has been triggered by this function. Please contact NAG. See Section 3.6.6 in the Essential Introduction for further information.

**NE_NO_LICENCE**
Your licence key may have expired or may not have been installed correctly. See Section 3.6.5 in the Essential Introduction for further information.

**NE_REAL**
On entry, \( q = \langle \text{value} \rangle \).
Constraint: \( q \geq 0.0 \).

On entry, \( r = \langle \text{value} \rangle \).
Constraint: \( r \geq 0.0 \).

On entry, \( s = \langle \text{value} \rangle \).
Constraint: \( s \geq \langle \text{value} \rangle \) and \( s \leq \langle \text{value} \rangle \).

On entry, \( s = \langle \text{value} \rangle \) and \( \beta = \langle \text{value} \rangle \).
Constraint: \( s^3 < \langle \text{value} \rangle \).

On entry, \( \sigma = \langle \text{value} \rangle \).
Constraint: \( \sigma > 0.0 \).

**NE_REAL_ARRAY**
On entry, \( t[(i)] = \langle \text{value} \rangle \).
Constraint: \( t[i] \geq \langle \text{value} \rangle \).

On entry, \( x[(i)] = \langle \text{value} \rangle \).
Constraint: \( x[i] \geq \langle \text{value} \rangle \) and \( x[i] \leq \langle \text{value} \rangle \).

7 Accuracy
The accuracy of the output will be bounded by the accuracy of the cumulative bivariate Normal distribution function. The algorithm of Genz (2004) is used, as described in the document for nag_bivariate_normal_dist (g01hac), giving a maximum absolute error of less than \( 5 \times 10^{-16} \). The univariate cumulative Normal distribution function also forms part of the evaluation (see nag_cumul_normal (s15abc) and nag_erfc (s15adc)).

8 Parallelism and Performance
nag_amer_bs_price (s30qcc) is threaded by NAG for parallel execution in multithreaded implementations of the NAG Library.

Please consult the X06 Chapter Introduction for information on how to control and interrogate the OpenMP environment used within this function. Please also consult the Users’ Note for your implementation for any additional implementation-specific information.

9 Further Comments
None.

10 Example
This example computes the price of an American call with a time to expiry of 3 months, a stock price of 110 and a strike price of 100. The risk-free interest rate is 8\% per year, there is an annual dividend return of 12\% and the volatility is 20\% per year.
