

NAG Library Function Document

nag_reml_mixed_regsn (g02jac)

1 Purpose

nag_reml_mixed_regsn (g02jac) fits a linear mixed effects regression model using restricted maximum likelihood (REML).

2 Specification

```
#include <nag.h>
#include <nagg02.h>

void nag_reml_mixed_regsn (Integer n, Integer ncol, const double dat[],
    Integer tddat, const Integer levels[], Integer yvid, Integer cwid,
    Integer nfv, const Integer fvid[], Integer fint, Integer nrv,
    const Integer rvid[], Integer nvpr, const Integer vpr[], Integer rint,
    Integer svid, double gamma[], Integer *nff, Integer *nrf, Integer *df,
    double *reml, Integer lb, double b[], double se[], Integer maxit,
    double tol, Integer *warn, NagError *fail)
```

3 Description

nag_reml_mixed_regsn (g02jac) fits a model of the form:

$$y = X\beta + Z\nu + \epsilon$$

where

y is a vector of n observations on the dependent variable,

X is a known n by p design matrix for the fixed independent variables,

β is a vector of length p of unknown *fixed effects*,

Z is a known n by q design matrix for the random independent variables,

ν is a vector of length q of unknown *random effects*,

and

ϵ is a vector of length n of unknown random errors.

Both ν and ϵ are assumed to have a Gaussian distribution with expectation zero and

$$\text{Var} \begin{bmatrix} \nu \\ \epsilon \end{bmatrix} = \begin{bmatrix} G & 0 \\ 0 & R \end{bmatrix}$$

where $R = \sigma_R^2 I$, I is the $n \times n$ identity matrix and G is a diagonal matrix. It is assumed that the random variables, Z , can be subdivided into $g \leq q$ groups with each group being identically distributed with expectations zero and variance σ_i^2 . The diagonal elements of matrix G therefore take one of the values $\{\sigma_i^2 : i = 1, 2, \dots, g\}$, depending on which group the associated random variable belongs to.

The model therefore contains three sets of unknowns, the fixed effects, β , the random effects ν and a vector of $g + 1$ variance components, γ , where $\gamma = \{\sigma_1^2, \sigma_2^2, \dots, \sigma_{g-1}^2, \sigma_g^2, \sigma_R^2\}$. Rather than working directly with γ , nag_reml_mixed_regsn (g02jac) uses an iterative process to estimate $\gamma^* = \{\sigma_1^2/\sigma_R^2, \sigma_2^2/\sigma_R^2, \dots, \sigma_{g-1}^2/\sigma_R^2, \sigma_g^2/\sigma_R^2, 1\}$. Due to the iterative nature of the estimation a set of initial values, γ_0 , for γ^* is required. nag_reml_mixed_regsn (g02jac) allows these initial values either to be supplied by you or calculated from the data using the minimum variance quadratic unbiased estimators (MIVQUE0) suggested by Rao (1972).

nag_reml_mixed_regsn (g02jac) fits the model using a quasi-Newton algorithm to maximize the restricted log-likelihood function:

$$-2l_R = \log(|V|) + (n-p)\log(r'V^{-1}r) + \log|X'V^{-1}X| + (n-p)(1 + \log(2\pi/(n-p)))$$

where

$$V = ZGZ' + R, \quad r = y - Xb \quad \text{and} \quad b = (X'V^{-1}X)^{-1}X'V^{-1}y.$$

Once the final estimates for γ^* have been obtained, the value of σ_R^2 is given by:

$$\sigma_R^2 = (r'V^{-1}r)/(n-p).$$

Case weights, W_c , can be incorporated into the model by replacing $X'X$ and $Z'Z$ with $X'W_cX$ and $Z'W_cZ$ respectively, for a diagonal weight matrix W_c .

The log-likelihood, l_R , is calculated using the sweep algorithm detailed in Wolfinger *et al.* (1994).

5 Arguments

- 1: **n** – Integer *Input*
On entry: n , the number of observations.
Constraint: $n \geq 1$.
- 2: **ncol** – Integer *Input*
On entry: the number of columns in the data matrix, **DAT**.
Constraint: $ncol \geq 1$.
- 3: **dat**[$n \times tddat$] – const double *Input*
Note: where **DAT**(i, j) appears in this document, it refers to the array element **dat**[($i - 1$) \times **tddat** + $j - 1$].
On entry: array containing all of the data. For the i th observation:
DAT($i, yvid$) holds the dependent variable, y ;
if **cwid** $\neq 0$, **DAT**($i, cwid$) holds the case weights;
if **svid** $\neq 0$, **DAT**($i, svid$) holds the subject variable.
The remaining columns hold the values of the independent variables.
Constraints:
if **cwid** $\neq 0$, **DAT**($i, cwid$) ≥ 0.0 ;
if **levels**[$j - 1$] $\neq 1$, $1 \leq \mathbf{DAT}(i, j) \leq \mathbf{levels}[j - 1]$.

- 4: **tddat** – Integer *Input*
On entry: the stride separating matrix column elements in the array **dat**.
Constraint: **tddat** \geq **ncol**.
- 5: **levels[ncol]** – const Integer *Input*
On entry: **levels**[$i - 1$] contains the number of levels associated with the i th variable of the data matrix **DAT**. If this variable is continuous or binary (i.e., only takes the values zero or one) then **levels**[$i - 1$] should be 1; if the variable is discrete then **levels**[$i - 1$] is the number of levels associated with it and **DAT**(j, i) is assumed to take the values 1 to **levels**[$i - 1$], for $j = 1, 2, \dots, \mathbf{n}$.
Constraint: **levels**[$i - 1$] ≥ 1 , for $i = 1, 2, \dots, \mathbf{ncol}$.
- 6: **yvid** – Integer *Input*
On entry: the column of **DAT** holding the dependent, y , variable.
Constraint: $1 \leq \mathbf{yvid} \leq \mathbf{ncol}$.
- 7: **cwid** – Integer *Input*
On entry: the column of **DAT** holding the case weights.
 If **cwid** = 0, no weights are used.
Constraint: $0 \leq \mathbf{cwid} \leq \mathbf{ncol}$.
- 8: **nfv** – Integer *Input*
On entry: the number of independent variables in the model which are to be treated as being fixed.
Constraint: $0 \leq \mathbf{nfv} < \mathbf{ncol}$.
- 9: **fvid[nfv]** – const Integer *Input*
On entry: the columns of the data matrix **DAT** holding the fixed independent variables with **fvid**[$i - 1$] holding the column number corresponding to the i th fixed variable.
Constraint: $1 \leq \mathbf{fvid}[i - 1] \leq \mathbf{ncol}$, for $i = 1, 2, \dots, \mathbf{nfv}$.
- 10: **fint** – Integer *Input*
On entry: flag indicating whether a fixed intercept is included (**fint** = 1).
Constraint: **fint** = 0 or 1.
- 11: **nrv** – Integer *Input*
On entry: the number of independent variables in the model which are to be treated as being random.
Constraints:

$$0 \leq \mathbf{nrv} < \mathbf{ncol};$$

$$\mathbf{nrv} + \mathbf{rint} > 0.$$
- 12: **rvid[nrv]** – const Integer *Input*
On entry: the columns of the data matrix **DAT** holding the random independent variables with **rvid**[$i - 1$] holding the column number corresponding to the i th random variable.
Constraint: $1 \leq \mathbf{rvid}[i - 1] \leq \mathbf{ncol}$, for $i = 1, 2, \dots, \mathbf{nrv}$.

- 13: **nvpr** – Integer *Input*
On entry: if **rint** = 1 and **svid** ≠ 0, **nvpr** is the number of variance components being estimated – 2, ($g - 1$), else **nvpr** = g .
 If **nrν** = 0, **nvpr** is not referenced.
Constraint: if **nrν** ≠ 0, $1 \leq \mathbf{nvpr} \leq \mathbf{nrν}$.
- 14: **vpr**[**nrν**] – const Integer *Input*
On entry: **vpr**[$i - 1$] holds a flag indicating the variance of the i th random variable. The variance of the i th random variable is σ_j^2 , where $j = \mathbf{vpr}[i - 1] + 1$ if **rint** = 1 and **svid** ≠ 0 and $j = \mathbf{vpr}[i - 1]$ otherwise. Random variables with the same value of j are assumed to be taken from the same distribution.
Constraint: $1 \leq \mathbf{vpr}[i - 1] \leq \mathbf{nvpr}$, for $i = 1, 2, \dots, \mathbf{nrν}$.
- 15: **rint** – Integer *Input*
On entry: flag indicating whether a random intercept is included (**rint** = 1).
 If **svid** = 0, **rint** is not referenced.
Constraint: **rint** = 0 or 1.
- 16: **svid** – Integer *Input*
On entry: the column of **DAT** holding the subject variable.
 If **svid** = 0, no subject variable is used.
 Specifying a subject variable is equivalent to specifying the interaction between that variable and all of the random-effects. Letting the notation $Z_1 \times Z_S$ denote the interaction between variables Z_1 and Z_S , fitting a model with **rint** = 0, random-effects $Z_1 + Z_2$ and subject variable Z_S is equivalent to fitting a model with random-effects $Z_1 \times Z_S + Z_2 \times Z_S$ and no subject variable. If **rint** = 1 the model is equivalent to fitting $Z_S + Z_1 \times Z_S + Z_2 \times Z_S$ and no subject variable.
Constraint: $0 \leq \mathbf{svid} \leq \mathbf{ncol}$.
- 17: **gamma**[**nvpr** + 2] – double *Input/Output*
On entry: holds the initial values of the variance components, γ_0 , with **gamma**[$i - 1$] the initial value for σ_i^2/σ_R^2 , for $i = 1, 2, \dots, g$. If **rint** = 1 and **svid** ≠ 0, $g = \mathbf{nvpr} + 1$, else $g = \mathbf{nvpr}$.
 If **gamma**[0] = –1.0, the remaining elements of **gamma** are ignored and the initial values for the variance components are estimated from the data using MIVQUE0.
On exit: **gamma**[$i - 1$], for $i = 1, 2, \dots, g$, holds the final estimate of σ_i^2 and **gamma**[g] holds the final estimate for σ_R^2 .
Constraint: **gamma**[0] = –1.0 or **gamma**[$i - 1$] ≥ 0.0, for $i = 1, 2, \dots, g$.
- 18: **nff** – Integer * *Output*
On exit: the number of fixed effects estimated (i.e., the number of columns, p , in the design matrix X).
- 19: **nrf** – Integer * *Output*
On exit: the number of random effects estimated (i.e., the number of columns, q , in the design matrix Z).
- 20: **df** – Integer * *Output*
On exit: the degrees of freedom.

21: **reml** – double * *Output*

On exit: $-2l_R(\hat{\gamma})$ where l_R is the log of the restricted maximum likelihood calculated at $\hat{\gamma}$, the estimated variance components returned in **gamma**.

22: **lb** – Integer *Input*

On entry: the size of the array **b**.

C o n s t r a i n t :

$$\mathbf{lb} \geq \mathbf{fint} + \sum_{i=1}^{\mathbf{nfv}} \max(\mathbf{levels}[\mathbf{fvid}[i-1]-1] - 1, 1) + L_S \times \left(\mathbf{rint} + \sum_{i=1}^{\mathbf{nrV}} \mathbf{levels}[\mathbf{rvid}[i-1]-1] \right)$$

where $L_S = \mathbf{levels}[\mathbf{svid}-1]$ if **svid** $\neq 0$ and 1 otherwise.

23: **b[lb]** – double *Output*

On exit: the parameter estimates, (β, ν) , with the first **nff** elements of **b** containing the fixed effect parameter estimates, β and the next **nrf** elements of **b** containing the random effect parameter estimates, ν .

Fixed effects

If **fint** = 1, **b**[0] contains the estimate of the fixed intercept. Let L_i denote the number of levels associated with the i th fixed variable, that is $L_i = \mathbf{levels}[\mathbf{fvid}[i-1]-1]$. Define

if **fint** = 1, $F_1 = 2$ else if **fint** = 0, $F_1 = 1$;

$F_{i+1} = F_i + \max(L_i - 1, 1)$, $i \geq 1$.

Then for $i = 1, 2, \dots, \mathbf{nfv}$:

if $L_i > 1$, **b**[$F_i + j - 3$] contains the parameter estimate for the j th level of the i th fixed variable, for $j = 2, 3, \dots, L_i$;

if $L_i \leq 1$, **b**[$F_i - 1$] contains the parameter estimate for the i th fixed variable.

Random effects

Redefining L_i to denote the number of levels associated with the i th random variable, that is $L_i = \mathbf{levels}[\mathbf{rvid}[i-1]-1]$. Define

if **rint** = 1, $R_1 = 2$ else if **rint** = 0, $R_1 = 1$;

$R_{i+1} = R_i + L_i$, $i \geq 1$.

Then for $i = 1, 2, \dots, \mathbf{nrV}$:

if **svid** = 0,

if $L_i > 1$, **b**[$\mathbf{nff} + R_i + j - 2$] contains the parameter estimate for the j th level of the i th random variable, for $j = 1, 2, \dots, L_i$;

if $L_i \leq 1$, **b**[$\mathbf{nff} + R_i - 1$] contains the parameter estimate for the i th random variable;

if **svid** $\neq 0$,

let L_S denote the number of levels associated with the subject variable, that is $L_S = \mathbf{levels}[\mathbf{svid}-1]$;

if $L_i > 1$, **b**[$\mathbf{nff} + (s-1)L_S + R_i + j - 2$] contains the parameter estimate for the interaction between the s th level of the subject variable and the j th level of the i th random variable, for $s = 1, 2, \dots, L_S$ and $j = 1, 2, \dots, L_i$;

if $L_i \leq 1$, **b**[$\mathbf{nff} + (s-1)L_S + R_i - 1$] contains the parameter estimate for the interaction between the s th level of the subject variable and the i th random variable, for $s = 1, 2, \dots, L_S$;

if **rint** = 1, **b**[**nff**] contains the estimate of the random intercept.

- 24: **se[*lb*]** – double *Output*
On exit: the standard errors of the parameter estimates given in **b**.
- 25: **maxit** – Integer *Input*
On entry: the maximum number of iterations.
 If **maxit** < 0, the default value of 100 is used.
 If **maxit** = 0, the parameter estimates (β, ν) and corresponding standard errors are calculated based on the value of γ_0 supplied in **gamma**.
- 26: **tol** – double *Input*
On entry: the tolerance used to assess convergence.
 If **tol** \leq 0.0, the default value of $\epsilon^{0.7}$ is used, where ϵ is the *machine precision*.
- 27: **warn** – Integer * *Output*
On exit: is set to 1 if a variance component was estimated to be a negative value during the fitting process. Otherwise **warn** is set to 0.
 If **warn** = 1, the negative estimate is set to zero and the estimation process allowed to continue.
- 28: **fail** – NagError * *Input/Output*
 The NAG error argument (see Section 2.7 in How to Use the NAG Library and its Documentation).

6 Error Indicators and Warnings

NE_ALLOC_FAIL

Dynamic memory allocation failed.

See Section 3.2.1.2 in How to Use the NAG Library and its Documentation for further information.

NE_BAD_PARAM

On entry, argument $\langle value \rangle$ had an illegal value.

On entry, invalid data: categorical variable with value greater than that specified in **levels**.

NE_CONV

Routine failed to converge in **maxit** iterations: **maxit** = $\langle value \rangle$.

See Section 10 for advice.

NE_FAIL_TOL

Routine failed to converge to specified tolerance: **tol** = $\langle value \rangle$.

See Section 10 for advice.

NE_INT

On entry, **fint** = $\langle value \rangle$.

Constraint: **fint** = 0 or 1.

On entry, **lb** too small: **lb** = $\langle value \rangle$.

On entry, **levels**[*I*] < 1, for at least one *I*.

On entry, **n** < 1 (nonzero weighted observations): **n** = $\langle value \rangle$.

On entry, **n** = $\langle value \rangle$.

Constraint: **n** \geq 1.

On entry, **ncol** = $\langle value \rangle$.

Constraint: $1 \leq \mathbf{fvid}[i] \leq \mathbf{ncol}$, for all i .

On entry, **ncol** = $\langle value \rangle$.

Constraint: $1 \leq \mathbf{rvid}[i] \leq \mathbf{ncol}$, for all i .

On entry, **ncol** = $\langle value \rangle$.

Constraint: **ncol** \geq 1.

On entry, **nvpr** = $\langle value \rangle$.

Constraint: $1 \leq \mathbf{vpr}[i] \leq \mathbf{nvpr}$, for all i .

On entry, **rint** = $\langle value \rangle$.

Constraint: **rint** = 0 or 1.

NE_INT_2

On entry, **cwid** = $\langle value \rangle$ and **ncol** = $\langle value \rangle$.

Constraint: $0 \leq \mathbf{cwid} \leq \mathbf{ncol}$ and any supplied weights must be ≥ 0.0 .

On entry, **nfv** = $\langle value \rangle$ and **ncol** = $\langle value \rangle$.

Constraint: $0 \leq \mathbf{nfv} < \mathbf{ncol}$.

On entry, **nrv** = $\langle value \rangle$ and **ncol** = $\langle value \rangle$.

Constraint: $0 \leq \mathbf{nrv} < \mathbf{ncol}$ and $\mathbf{nrv} + \mathbf{rint} > 0$.

On entry, **nvpr** = $\langle value \rangle$ and **nrv** = $\langle value \rangle$.

Constraint: $0 \leq \mathbf{nvpr} \leq \mathbf{nrv}$ and ($\mathbf{nrv} \neq 0$ or $\mathbf{nvpr} \geq 1$).

On entry, **svid** = $\langle value \rangle$ and **ncol** = $\langle value \rangle$.

Constraint: $0 \leq \mathbf{svid} \leq \mathbf{ncol}$.

On entry, **tddat** = $\langle value \rangle$ and **ncol** = $\langle value \rangle$.

Constraint: **tddat** \geq **ncol**.

On entry, **yvid** = $\langle value \rangle$ and **ncol** = $\langle value \rangle$.

Constraint: $1 \leq \mathbf{yvid} \leq \mathbf{ncol}$.

NE_INTERNAL_ERROR

An internal error has occurred in this function. Check the function call and any array sizes. If the call is correct then please contact NAG for assistance.

An unexpected error has been triggered by this function. Please contact NAG.

See Section 3.6.6 in How to Use the NAG Library and its Documentation for further information.

NE_NO_LICENCE

Your licence key may have expired or may not have been installed correctly.

See Section 3.6.5 in How to Use the NAG Library and its Documentation for further information.

NE_REAL

On entry, **gamma**[i] $<$ 0.0, for at least one i .

NE_ZERO_DOF_ERROR

Degrees of freedom $<$ 1: **df** = $\langle value \rangle$.

This is due to the number of parameters exceeding the effective number of observations.

7 Accuracy

The accuracy of the results can be adjusted through the use of the **tol** argument.

8 Parallelism and Performance

nag_reml_mixed_regsn (g02jac) is threaded by NAG for parallel execution in multithreaded implementations of the NAG Library.

nag_reml_mixed_regsn (g02jac) makes calls to BLAS and/or LAPACK routines, which may be threaded within the vendor library used by this implementation. Consult the documentation for the vendor library for further information.

Please consult the x06 Chapter Introduction for information on how to control and interrogate the OpenMP environment used within this function. Please also consult the Users' Note for your implementation for any additional implementation-specific information.

9 Further Comments

Wherever possible any block structure present in the design matrix Z should be modelled through a subject variable, specified via **svid**, rather than being explicitly entered into **dat**.

nag_reml_mixed_regsn (g02jac) uses an iterative process to fit the specified model and for some problems this process may fail to converge (see **fail.code** = NE_CONV or NE_FAIL_TOL). If the function fails to converge then the maximum number of iterations (see **maxit**) or tolerance (see **tol**) may require increasing; try a different starting estimate in **gamma**. Alternatively, the model can be fit using maximum likelihood (see nag_ml_mixed_regsn (g02jbc)) or using the noniterative MIVQUE0.

To fit the model just using MIVQUE0, the first element of **gamma** should be set to -1.0 and **maxit** should be set to zero.

Although the quasi-Newton algorithm used in nag_reml_mixed_regsn (g02jac) tends to require more iterations before converging compared to the Newton–Raphson algorithm recommended by Wolfinger *et al.* (1994), it does not require the second derivatives of the likelihood function to be calculated and consequentially takes significantly less time per iteration.

10 Example

The following dataset is taken from Stroup (1989) and arises from a balanced split-plot design with the whole plots arranged in a randomized complete block-design.

In this example the full design matrix for the random independent variable, Z , is given by:

$$Z = \begin{pmatrix} 1 & 1 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\ 1 & 0 & 1 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\ 1 & 0 & 0 & 1 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 1 & 1 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 1 & 0 & 1 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 1 & 0 & 0 & 1 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 1 & 1 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 1 & 0 & 1 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 1 & 0 & 0 & 1 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 1 & 1 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 1 & 0 & 1 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 1 & 0 & 0 & 1 \\ 1 & 1 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\ 1 & 0 & 1 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\ 1 & 0 & 0 & 1 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 1 & 1 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 1 & 0 & 1 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 1 & 0 & 0 & 1 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 1 & 1 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 1 & 0 & 1 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 1 & 0 & 0 & 1 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 1 & 1 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 1 & 0 & 1 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 1 & 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 1 & 0 & 0 & 1 & 0 \end{pmatrix}$$

$$= \begin{pmatrix} A & 0 & 0 & 0 \\ 0 & A & 0 & 0 \\ 0 & 0 & A & 0 \\ 0 & 0 & 0 & A \\ A & 0 & 0 & 0 \\ 0 & A & 0 & 0 \\ 0 & 0 & A & 0 \\ 0 & 0 & 0 & A \end{pmatrix}, \quad (1)$$

where

$$A = \begin{pmatrix} 1 & 1 & 0 & 0 \\ 1 & 0 & 1 & 0 \\ 1 & 0 & 0 & 1 \end{pmatrix}.$$

The block structure evident in (1) is modelled by specifying a four-level subject variable, taking the values $\{1, 1, 1, 2, 2, 2, 3, 3, 3, 4, 4, 4, 1, 1, 1, 2, 2, 2, 3, 3, 3, 4, 4, 4\}$. The first column of 1s is added to A by setting $\mathbf{rint} = 1$. The remaining columns of A are specified by a three level factor, taking the values, $\{1, 2, 3, 1, 2, 3, 1, \dots\}$.
