NAG Library Routine Document

F11JBF

Note: before using this routine, please read the Users' Note for your implementation to check the interpretation of *bold italicised* terms and other implementation-dependent details.

1 Purpose

F11JBF solves a system of linear equations involving the incomplete Cholesky preconditioning matrix generated by F11JAF.

2 Specification

SUBROUTINE F11JBF (N, A, LA, IROW, ICOL, IPIV, ISTR, CHECK, Y, X, IFAIL)

```
INTEGER N, LA, IROW(LA), ICOL(LA), IPIV(N), ISTR(N+1), IFAIL
REAL (KIND=nag_wp) A(LA), Y(N), X(N)
CHARACTER(1) CHECK
```

3 Description

F11JBF solves a system of linear equations

Mx = y

involving the preconditioning matrix $M = PLDL^{T}P^{T}$, corresponding to an incomplete Cholesky decomposition of a sparse symmetric matrix stored in symmetric coordinate storage (SCS) format (see Section 2.1.2 in the F11 Chapter Introduction), as generated by F11JAF.

In the above decomposition L is a lower triangular sparse matrix with unit diagonal, D is a diagonal matrix and P is a permutation matrix. L and D are supplied to F11JBF through the matrix

$$C = L + D^{-1} - I$$

which is a lower triangular N by N sparse matrix, stored in SCS format, as returned by F11JAF. The permutation matrix P is returned from F11JAF via the array IPIV.

It is envisaged that a common use of F11JBF will be to carry out the preconditioning step required in the application of F11GEF to sparse symmetric linear systems. F11JBF is used for this purpose by the Black Box routine F11JCF.

F11JBF may also be used in combination with F11JAF to solve a sparse symmetric positive definite system of linear equations directly (see Section 8.4 in F11JAF). This use of F11JBF is demonstrated in Section 9.

4 References

None.

5 Parameters

1: N - INTEGER

On entry: n, the order of the matrix M. This **must** be the same value as was supplied in the preceding call to F11JAF.

Constraint: $N \ge 1$.

Input

2:	A(LA) – REAL (KIND=nag_wp) array	Input
	On entry: the values returned in the array A by a previous call to F11JAF.	
3:	LA – INTEGER	Input
	<i>On entry</i> : the dimension of the arrays A, IROW and ICOL as declared in the (sub)prowhich F11JBF is called. This must be the same value returned by the preceding call	0
4: 5: 6: 7:	IROW(LA) - INTEGER array ICOL(LA) - INTEGER array IPIV(N) - INTEGER array ISTR(N + 1) - INTEGER array <i>On entry</i> : the values returned in arrays IROW, ICOL, IPIV and ISTR by a previous call	Input Input Input Input to F11JAF.
8:	CHECK – CHARACTER(1)	Input
	On entry: specifies whether or not the input data should be checked.	
	CHECK = 'C' Checks are carried out on the values of N, IROW, ICOL, IPIV and ISTR.	
	CHECK = 'N' No checks are carried out.	
	See also Section 8.2.	
	Constraint: $CHECK = 'C'$ or 'N'.	
9:	Y(N) – REAL (KIND=nag_wp) array	Input
	On entry: the right-hand side vector y.	
10:	X(N) - REAL (KIND=nag_wp) array	Output
	On exit: the solution vector x .	
11:	IFAIL – INTEGER	nput/Output
	On entry: IFAIL must be set to $0, -1$ or 1. If you are unfamiliar with this parameter refer to Section 3.3 in the Essential Introduction for details.	you should
	For environments where it might be inappropriate to halt program execution when	an error is

For environments where it might be inappropriate to halt program execution when an error is detected, the value -1 or 1 is recommended. If the output of error messages is undesirable, then the value 1 is recommended. Otherwise, if you are not familiar with this parameter, the recommended value is 0. When the value -1 or 1 is used it is essential to test the value of IFAIL on exit.

On exit: IFAIL = 0 unless the routine detects an error or a warning has been flagged (see Section 6).

6 Error Indicators and Warnings

If on entry IFAIL = 0 or -1, explanatory error messages are output on the current error message unit (as defined by X04AAF).

Errors or warnings detected by the routine:

IFAIL = 1

On entry, CHECK \neq 'C' or 'N'.

IFAIL = 2

On entry, N < 1.

IFAIL = 3

On entry, the SCS representation of the preconditioning matrix M is invalid. Further details are given in the error message. Check that the call to F11JBF has been preceded by a valid call to F11JAF and that the arrays A, IROW, ICOL, IPIV and ISTR have not been corrupted between the two calls.

7 Accuracy

The computed solution x is the exact solution of a perturbed system of equations $(M + \delta M)x = y$, where

$$|\delta M| \le c(n)\epsilon P|L||D||L^{\mathsf{T}}|P^{\mathsf{T}},$$

c(n) is a modest linear function of n, and ϵ is the *machine precision*.

8 **Further Comments**

8.1 Timing

The time taken for a call to F11JBF is proportional to the value of NNZC returned from F11JAF.

8.2 Use of CHECK

It is expected that a common use of F11JBF will be to carry out the preconditioning step required in the application of F11GEF to sparse symmetric linear systems. In this situation F11JBF is likely to be called many times with the same matrix M. In the interests of both reliability and efficiency, you are recommended to set CHECK = 'C' for the first of such calls, and to set CHECK = 'N' for all subsequent calls.

9 Example

This example reads in a symmetric positive definite sparse matrix A and a vector y. It then calls F11JAF, with LFILL = -1 and DTOL = 0.0, to compute the **complete** Cholesky decomposition of A:

$$A = PLDL^{\mathrm{T}}P^{\mathrm{T}}.$$

Finally it calls F11JBF to solve the system

$$PLDL^{\mathsf{T}}P^{\mathsf{T}}x = y.$$
