NAG Library Routine Document

G05KHF

Note: before using this routine, please read the Users' Note for your implementation to check the interpretation of *bold italicised* terms and other implementation-dependent details.

1 Purpose

G05KHF allows for the generation of multiple, independent, sequences of pseudorandom numbers using the leap-frog method.

2 Specification

SUBROUTINE GO5KHF (N, K, STATE, IFAIL) INTEGER N, K, STATE(*), IFAIL

3 Description

G05KHF adjusts a base generator to allow multiple, independent, sequences of pseudorandom numbers to be generated via the leap-frog method (see the G05 Chapter Introduction for details).

If, prior to calling G05KHF the base generator defined by STATE would produce random numbers x_1, x_2, x_3, \ldots , then after calling G05KHF the generator will produce random numbers $x_k, x_{k+n}, x_{k+2n}, x_{k+3n}, \ldots$

One of the initialization routines G05KFF (for a repeatable sequence if computed sequentially) or G05KGF (for a non-repeatable sequence) must be called prior to the first call to G05KHF.

The leap-frog algorithm can be used in conjunction with the NAG basic generator, both the Wichmann-Hill I and Wichmann-Hill II generators, the Mersenne Twister and L'Ecuyer.

5 Arguments

1: N – INTEGER

On entry: n, the total number of sequences required.

Constraint: N > 0.

2: K – INTEGER

On entry: k, the number of the current sequence.

Constraint: $0 < K \le N$.

3: STATE(*) - INTEGER array

Note: the actual argument supplied **must** be the array STATE supplied to the initialization routines G05KFF or G05KGF.

On entry: contains information on the selected base generator and its current state.

On exit: contains updated information on the state of the generator.

Input

Input

Communication Array

4: IFAIL – INTEGER

Input/Output

On entry: IFAIL must be set to 0, -1 or 1. If you are unfamiliar with this argument you should refer to Section 3.4 in How to Use the NAG Library and its Documentation for details.

For environments where it might be inappropriate to halt program execution when an error is detected, the value -1 or 1 is recommended. If the output of error messages is undesirable, then the value 1 is recommended. Otherwise, if you are not familiar with this argument, the recommended value is 0. When the value -1 or 1 is used it is essential to test the value of IFAIL on exit.

On exit: IFAIL = 0 unless the routine detects an error or a warning has been flagged (see Section 6).

6 Error Indicators and Warnings

If on entry IFAIL = 0 or -1, explanatory error messages are output on the current error message unit (as defined by X04AAF).

Errors or warnings detected by the routine:

IFAIL = 1

On entry, $N = \langle value \rangle$. Constraint: $N \ge 1$.

IFAIL = 2

On entry, $K = \langle value \rangle$ and $N = \langle value \rangle$. Constraint: $0 < K \le N$.

IFAIL = 3

On entry, STATE vector has been corrupted or not initialized.

IFAIL = 4

On entry, cannot use leap-frog with the base generator defined by STATE.

IFAIL = -99

An unexpected error has been triggered by this routine. Please contact NAG.

See Section 3.9 in How to Use the NAG Library and its Documentation for further information.

IFAIL = -399

Your licence key may have expired or may not have been installed correctly.

See Section 3.8 in How to Use the NAG Library and its Documentation for further information.

IFAIL = -999

Dynamic memory allocation failed.

See Section 3.7 in How to Use the NAG Library and its Documentation for further information.

7 Accuracy

Not applicable.

8 Parallelism and Performance

G05KHF is not threaded in any implementation.

9 Further Comments

The leap-frog method tends to be less efficient than other methods of producing multiple, independent sequences. See the G05 Chapter Introduction for alternative choices.

10 Example

This example creates three independent sequences using G05KHF, after initialization by G05KFF. Five variates from a uniform distribution are then generated from each sequence using G05SAF.
