

NAG Toolbox

nag_lapack_zsprfs (f07qv)

1 Purpose

nag_lapack_zsprfs (f07qv) returns error bounds for the solution of a complex symmetric system of linear equations with multiple right-hand sides, $AX = B$, using packed storage. It improves the solution by iterative refinement, in order to reduce the backward error as much as possible.

2 Syntax

```
[x, ferr, berr, info] = nag_lapack_zsprfs(uplo, ap, afp, ipiv, b, x, 'n', n,
'nrhs_p', nrhs_p)
[x, ferr, berr, info] = f07qv(uplo, ap, afp, ipiv, b, x, 'n', n, 'nrhs_p',
nrhs_p)
```

3 Description

nag_lapack_zsprfs (f07qv) returns the backward errors and estimated bounds on the forward errors for the solution of a complex symmetric system of linear equations with multiple right-hand sides $AX = B$, using packed storage. The function handles each right-hand side vector (stored as a column of the matrix B) independently, so we describe the function of nag_lapack_zsprfs (f07qv) in terms of a single right-hand side b and solution x .

Given a computed solution x , the function computes the *component-wise backward error* β . This is the size of the smallest relative perturbation in each element of A and b such that x is the exact solution of a perturbed system

$$(A + \delta A)x = b + \delta b$$

$$|\delta a_{ij}| \leq \beta |a_{ij}| \quad \text{and} \quad |\delta b_i| \leq \beta |b_i|.$$

Then the function estimates a bound for the *component-wise forward error* in the computed solution, defined by:

$$\max_i |x_i - \hat{x}_i| / \max_i |x_i|$$

where \hat{x} is the true solution.

For details of the method, see the F07 Chapter Introduction.

5 Parameters

5.1 Compulsory Input Parameters

1: **uplo** – CHARACTER(1)

Specifies whether the upper or lower triangular part of A is stored and how A is to be factorized.

uplo = 'U'

The upper triangular part of A is stored and A is factorized as $PUDU^T P^T$, where U is upper triangular.

uplo = 'L'

The lower triangular part of A is stored and A is factorized as $PLDL^T P^T$, where L is lower triangular.

Constraint: **uplo** = 'U' or 'L'.

2: **ap**(:) – COMPLEX (KIND=nag_wp) array

The dimension of the array **ap** must be at least $\max(1, \mathbf{n} \times (\mathbf{n} + 1)/2)$

The n by n original symmetric matrix A as supplied to nag_lapack_zsptrf (f07qr).

3: **afp**(:) – COMPLEX (KIND=nag_wp) array

The dimension of the array **afp** must be at least $\max(1, \mathbf{n} \times (\mathbf{n} + 1)/2)$

The factorization of A stored in packed form, as returned by nag_lapack_zsptrf (f07qr).

4: **ipiv**(:) – INTEGER array

The dimension of the array **ipiv** must be at least $\max(1, \mathbf{n})$

Details of the interchanges and the block structure of D , as returned by nag_lapack_zsptrf (f07qr).

5: **b**(ldb,:) – COMPLEX (KIND=nag_wp) array

The first dimension of the array **b** must be at least $\max(1, \mathbf{n})$.

The second dimension of the array **b** must be at least $\max(1, \mathbf{nrhs_p})$.

The n by r right-hand side matrix B .

6: **x**(ldx,:) – COMPLEX (KIND=nag_wp) array

The first dimension of the array **x** must be at least $\max(1, \mathbf{n})$.

The second dimension of the array **x** must be at least $\max(1, \mathbf{nrhs_p})$.

The n by r solution matrix X , as returned by nag_lapack_zsptfs (f07qs).

5.2 Optional Input Parameters

1: **n** – INTEGER

Default: the first dimension of the arrays **b**, **x** and the dimension of the array **ipiv**.

n , the order of the matrix A .

Constraint: $\mathbf{n} \geq 0$.

2: **nrhs_p** – INTEGER

Default: the second dimension of the arrays **b**, **x**. (An error is raised if these dimensions are not equal.)

r , the number of right-hand sides.

Constraint: $\mathbf{nrhs_p} \geq 0$.

5.3 Output Parameters

1: **x**(ldx,:) – COMPLEX (KIND=nag_wp) array

The first dimension of the array **x** will be $\max(1, \mathbf{n})$.

The second dimension of the array **x** will be $\max(1, \mathbf{nrhs_p})$.

The improved solution matrix X .

- 2: **ferr**(nrhs_p) – REAL (KIND=nag_wp) array
ferr(*j*) contains an estimated error bound for the *j*th solution vector, that is, the *j*th column of *X*, for $j = 1, 2, \dots, r$.
- 3: **berr**(nrhs_p) – REAL (KIND=nag_wp) array
berr(*j*) contains the component-wise backward error bound β for the *j*th solution vector, that is, the *j*th column of *X*, for $j = 1, 2, \dots, r$.
- 4: **info** – INTEGER
info = 0 unless the function detects an error (see Section 6).

6 Error Indicators and Warnings

info < 0

If **info** = $-i$, argument *i* had an illegal value. An explanatory message is output, and execution of the program is terminated.

7 Accuracy

The bounds returned in **ferr** are not rigorous, because they are estimated, not computed exactly; but in practice they almost always overestimate the actual error.

8 Further Comments

For each right-hand side, computation of the backward error involves a minimum of $16n^2$ real floating-point operations. Each step of iterative refinement involves an additional $24n^2$ real operations. At most five steps of iterative refinement are performed, but usually only one or two steps are required.

Estimating the forward error involves solving a number of systems of linear equations of the form $Ax = b$; the number is usually 5 and never more than 11. Each solution involves approximately $8n^2$ real operations.

The real analogue of this function is nag_lapack_dsprfs (f07ph).

9 Example

This example solves the system of equations $AX = B$ using iterative refinement and to compute the forward and backward error bounds, where

$$A = \begin{pmatrix} -0.39 - 0.71i & 5.14 - 0.64i & -7.86 - 2.96i & 3.80 + 0.92i \\ 5.14 - 0.64i & 8.86 + 1.81i & -3.52 + 0.58i & 5.32 - 1.59i \\ -7.86 - 2.96i & -3.52 + 0.58i & -2.83 - 0.03i & -1.54 - 2.86i \\ 3.80 + 0.92i & 5.32 - 1.59i & -1.54 - 2.86i & -0.56 + 0.12i \end{pmatrix}$$

and

$$B = \begin{pmatrix} -55.64 + 41.22i & -19.09 - 35.97i \\ -48.18 + 66.00i & -12.08 - 27.02i \\ -0.49 - 1.47i & 6.95 + 20.49i \\ -6.43 + 19.24i & -4.59 - 35.53i \end{pmatrix}.$$

Here *A* is symmetric, stored in packed form, and must first be factorized by nag_lapack_zsprtf (f07qr).

9.1 Program Text

```
function f07qv_example

fprintf('f07qv example results\n\n');

% Solve Ax = B, where A is complex symmetric matrix such that the
% lower triangular part is stored in packed format
uplo = 'L';
n = nag_int(4);
ap = [ -0.39 - 0.71i,   5.14 - 0.64i,  -7.86 - 2.96i,   3.80 + 0.92i, ...
       8.86 + 1.81i,  -3.52 + 0.58i,   5.32 - 1.59i,   ...
       -2.83 - 0.03i, -1.54 - 2.86i,   ...
       -0.56 + 0.12i];
b = [-55.64 + 41.22i, -19.09 - 35.97i;
     -48.18 + 66.00i, -12.08 - 27.02i;
     -0.49 - 1.47i,   6.95 + 20.49i;
     -6.43 + 19.24i, -4.59 - 35.53i];

% Factorize
[apf, ipiv, info] = f07qr( ...
                    uplo, n, ap);

% Solve
[x, info] = f07qs(uplo, apf, ipiv, b);

% Refine
[x, ferr, berr, info] = f07qv( ...
                            uplo, ap, apf, ipiv, b, x);

disp('Solution(s)');
disp(x);

fprintf('Backward errors (machine-dependent)\n  ')
fprintf('%11.1e', berr);
fprintf('\nEstimated forward error bounds (machine-dependent)\n  ')
fprintf('%11.1e', ferr);
fprintf('\n');
```

9.2 Program Results

```
f07qv example results
