# NAG Library Function Document nag_quad_md_sphere (d01fdc) 

## 1 Purpose

nag_quad_md_sphere (d01fdc) calculates an approximation to a definite integral in up to 30 dimensions, using the method of Sag and Szekeres (see Sag and Szekeres (1964)). The region of integration is an $n$-sphere, or by built-in transformation via the unit $n$-cube, any product region.

## 2 Specification

```
#include <nag.h>
#include <nagd01.h>
void nag_quad_md_sphere (Integer ndim,
    double (*f)(Integer ndim, const double x[], Nag_Comm *comm),
    double sigma,
    void (*region)(Integer ndim, const double x[], Integer j, double *c,
        double *d, Nag_Comm *comm),
    Integer limit, double r0, double u, double *result, Integer *ncalls,
    Nag_Comm *comm, NagError *fail)
```

## 3 Description

nag_quad_md_sphere (d01fdc) calculates an approximation to

$$
\begin{equation*}
\int_{\text {re of radius } \sigma} f\left(x_{1}, x_{2}, \ldots, x_{n}\right) d x_{1} d x_{2} \cdots d x_{n} \tag{1}
\end{equation*}
$$

or, more generally,

$$
\begin{equation*}
\int_{c_{1}}^{d_{1}} d x_{1} \ldots \int_{c_{n}}^{d_{n}} d x_{n} f\left(x_{1}, \ldots, x_{n}\right) \tag{2}
\end{equation*}
$$

where each $c_{i}$ and $d_{i}$ may be functions of $x_{j}(j<i)$.
The function uses the method of Sag and Szekeres (1964), which exploits a property of the shifted $p$-point trapezoidal rule, namely, that it integrates exactly all polynomials of degree $<p$ (see Krylov (1962)). An attempt is made to induce periodicity in the integrand by making a parameterised transformation to the unit $n$-sphere. The Jacobian of the transformation and all its direct derivatives vanish rapidly towards the surface of the unit $n$-sphere, so that, except for functions which have strong singularities on the boundary, the resulting integrand will be pseudo-periodic. In addition, the variation in the integrand can be considerably reduced, causing the trapezoidal rule to perform well.
Integrals of the form (1) are transformed to the unit $n$-sphere by the change of variables:

$$
x_{i}=y_{i} \frac{\sigma}{r} \tanh \left(\frac{u r}{1-r^{2}}\right)
$$

where $r^{2}=\sum_{i=1}^{n} y_{i}^{2}$ and $u$ is an adjustable parameter.
Integrals of the form (2) are first of all transformed to the $n$-cube $[-1,1]^{n}$ by a linear change of variables

$$
x_{i}=\left(\left(d_{i}+c_{i}\right)+\left(d_{i}-c_{i}\right) y_{i}\right) / 2
$$

and then to the unit sphere by a further change of variables

$$
y_{i}=\tanh \left(\frac{u z_{i}}{1-r}\right)
$$

where $r^{2}=\sum_{i=1}^{n} z_{i}^{2}$ and $u$ is again an adjustable parameter.
The parameter $u$ in these transformations determines how the transformed integrand is distributed between the origin and the surface of the unit $n$-sphere. A typical value of $u$ is 1.5 . For larger $u$, the integrand is concentrated toward the centre of the unit $n$-sphere, while for smaller $u$ it is concentrated toward the perimeter.
In performing the integration over the unit $n$-sphere by the trapezoidal rule, a displaced equidistant grid of size $h$ is constructed. The points of the mesh lie on concentric layers of radius

$$
r_{i}=\frac{h}{4} \sqrt{n+8(i-1)}, \quad i=1,2,3, \ldots
$$

The function requires you to specify an approximate maximum number of points to be used, and then computes the largest number of whole layers to be used, subject to an upper limit of 400 layers.
In practice, the rapidly-decreasing Jacobian makes it unnecessary to include the whole unit $n$-sphere and the integration region is limited by a user-specified cut-off radius $r_{0}<1$. The grid-spacing $h$ is determined by $r_{0}$ and the number of layers to be used. A typical value of $r_{0}$ is 0.8 .
Some experimentation may be required with the choice of $r_{0}$ (which determines how much of the unit $n$-sphere is included) and $u$ (which determines how the transformed integrand is distributed between the origin and surface of the unit $n$-sphere), to obtain best results for particular families of integrals. This matter is discussed further in Section 9.

## 5 Arguments

1: ndim - Integer
Input
On entry: $n$, the number of dimensions of the integral.
Constraint: $1 \leq \mathbf{n d i m} \leq 30$.
2: $\quad \mathbf{f}$ - function, supplied by the user
External Function
f must return the value of the integrand $f$ at a given point.

```
The specification of f}\mathrm{ is:
double f (Integer ndim, const double x[], Nag_Comm *comm)
1: ndim - Integer
                    Input
    On entry: n, the number of dimensions of the integral.
2: \mathbf{x}[\mathbf{ndim}] - const double}\quad\mathrm{ Input
    On entry: the coordinates of the point at which the integrand f must be evaluated.
3: comm - Nag_Comm *
    Pointer to structure of type Nag_Comm; the following members are relevant to f.
```

```
user - double *
iuser - Integer *
p - Pointer
```

The type Pointer will be void *. Before calling nag_quad_md_sphere (d01fdc) you may allocate memory and initialize these pointers with various quantities for use by $\mathbf{f}$ when called from nag_quad_md_sphere (d01fdc) (see Section 3.2.1.1 in the Essential Introduction).
sigma - double
On entry: indicates the region of integration.
$\boldsymbol{\operatorname { s i g m a }} \geq 0.0$
The integration is carried out over the $n$-sphere of radius sigma, centred at the origin.
$\boldsymbol{s i g m a}<0.0$
The integration is carried out over the product region described by region.
4: region - function, supplied by the user
External Function
If sigma $<0.0$, region must evaluate the limits of integration in any dimension.

## The specification of region is:

```
void region (Integer ndim, const double x[], Integer j, double *c,
    double *d, Nag_Comm *comm)
```

1: ndim - Integer Input

On entry: $n$, the number of dimensions of the integral.
2: $\mathbf{x}[\mathbf{n d i m}]$ - const double $\quad$ Input
On entry: $\mathbf{x}[0], \ldots, \mathbf{x}[j-2]$ contain the current values of the first $(j-1)$ variables, which may be used if necessary in calculating $c_{j}$ and $d_{j}$.

3: $\mathbf{j}$ - Integer Input
On entry: the index $j$ for which the limits of the range of integration are required.
4: $\quad \mathbf{c}-$ double *
Output
On exit: the lower limit $c_{j}$ of the range of $x_{j}$.
5: $\quad \mathbf{d}-$ double *
Output
On exit: the upper limit $d_{j}$ of the range of $x_{j}$.
6: $\quad$ comm - Nag_Comm *
Pointer to structure of type Nag_Comm; the following members are relevant to region.
user - double *
iuser - Integer *
p - Pointer
The type Pointer will be void *. Before calling nag_quad_md_sphere (d01fdc) you may allocate memory and initialize these pointers with various quantities for use by region when called from nag_quad_md_sphere (d01fdc) (see Section 3.2.1.1 in the Essential Introduction).

If sigma $\geq 0.0$, region is not called by nag_quad_md_sphere ( d 01 fdc ), but the NAG defined null function pointer NULLFN must be supplied.

5: limit - Integer
Input
On entry: the approximate maximum number of integrand evaluations to be used.
Constraint: limit $\geq 100$.
6: $\quad \mathbf{r 0}$ - double
Input
On entry: the cut-off radius on the unit $n$-sphere, which may be regarded as an adjustable parameter of the method.
Suggested value: a typical value is $\mathbf{r 0}=0.8$. (See also Section 9.)
Constraint: $0.0<\mathbf{r 0}<1.0$.

7: $\quad \mathbf{u}-$ double
Input
On entry: must specify an adjustable parameter of the transformation to the unit $n$-sphere.
Suggested value: a typical value is $\mathbf{u}=1.5$. (See also Section 9.)
Constraint: $\mathbf{u}>0.0$.
8: $\quad$ result - double *
Output
On exit: the approximation to the integral $I$.
9: ncalls - Integer *
Output
On exit: the actual number of integrand evaluations used. (See also Section 9.)
10: comm - Nag_Comm *
The NAG communication argument (see Section 3.2.1.1 in the Essential Introduction).

11: fail - NagError *
Input/Output
The NAG error argument (see Section 3.6 in the Essential Introduction).

## 6 Error Indicators and Warnings

## NE_ALLOC_FAIL

Dynamic memory allocation failed.
See Section 3.2.1.2 in the Essential Introduction for further information.

## NE BAD PARAM

On entry, argument $\langle v a l u e\rangle$ had an illegal value.

## NE_INT

On entry, limit $=\langle$ value $\rangle$.
Constraint: limit $\geq 100$.
On entry, ndim $=\langle$ value $\rangle$.
Constraint: $\mathbf{n d i m} \leq 30$.
On entry, ndim $=\langle$ value $\rangle$.
Constraint: $\operatorname{ndim} \geq 1$.

## NE_INTERNAL_ERROR

An internal error has occurred in this function. Check the function call and any array sizes. If the call is correct then please contact NAG for assistance.

An unexpected error has been triggered by this function. Please contact NAG.
See Section 3.6.6 in the Essential Introduction for further information.

## NE_NO_LICENCE

Your licence key may have expired or may not have been installed correctly. See Section 3.6.5 in the Essential Introduction for further information.

## NE_REAL

On entry, $\mathbf{r 0}=\langle$ value $\rangle$.
Constraint: $\mathbf{r 0}<1.0$.
On entry, $\mathbf{r 0}=\langle$ value $\rangle$.
Constraint: r0 $>0.0$.
On entry, $\mathbf{u}=\langle$ value $\rangle$.
Constraint: $\mathbf{u}>0.0$.

## 7 Accuracy

No error estimate is returned, but results may be verified by repeating with an increased value of limit (provided that this causes an increase in the returned value of ncalls).

## 8 Parallelism and Performance

Not applicable.

## 9 Further Comments

The time taken by nag_quad_md_sphere ( d 01 fdc ) will be approximately proportional to the returned value of ncalls, which, except in the circumstances outlined in (b) below, will be close to the given value of limit.
(a) Choice of $r_{0}$ and $u$

If the chosen combination of $r_{0}$ and $u$ is too large in relation to the machine accuracy it is possible that some of the points generated in the original region of integration may transform into points in the unit $n$-sphere which lie too close to the boundary surface to be distinguished from it to machine accuracy (despite the fact that $r_{0}<1$ ). To be specific, the combination of $r_{0}$ and $u$ is too large if

$$
\frac{u r_{0}}{1-r_{0}^{2}}>0.3465(t-1), \quad \text { if sigma } \geq 0.0
$$

or

$$
\frac{u r_{0}}{1-r_{0}}>0.3465(t-1), \quad \text { if sigma }<0.0
$$

where $t$ is the number of bits in the mantissa of a double number.
The contribution of such points to the integral is neglected. This may be justified by appeal to the fact that the Jacobian of the transformation rapidly approaches zero towards the surface. Neglect of these points avoids the occurrence of overflow with integrands which are infinite on the boundary.
(b) Values of limit and ncalls
limit is an approximate upper limit to the number of integrand evaluations, and may not be chosen less than 100 . There are two circumstances when the returned value of ncalls (the actual number of evaluations used) may be significantly less than limit.

Firstly, as explained in (a), an unsuitably large combination of $r_{0}$ and $u$ may result in some of the points being unusable. Such points are not included in the returned value of ncalls.

Secondly, no more than 400 layers will ever be used, no matter how high limit is set. This places an effective upper limit on ncalls as follows:

$$
\begin{array}{lr}
n=1: & 56 \\
n=2: & 1252 \\
n=3: & 23690 \\
n=4: & 394528 \\
n=5: & 5956906
\end{array}
$$

## 10 Example

This example calculates the integral

$$
\iint_{s} \int \frac{d x_{1} d x_{2} d x_{3}}{\sqrt{\sigma^{2}-r^{2}}}=22.2066
$$

where $s$ is the 3 -sphere of radius $\sigma, r^{2}=x_{1}^{2}+x_{2}^{2}+x_{3}^{2}$ and $\sigma=1.5$. Both sphere-to-sphere and general product region transformations are used. For the former, we use $r_{0}=0.9$ and $u=1.5$; for the latter, $r_{0}=0.8$ and $u=1.5$.
