# NAG Library Function Document

# nag_multi_normal (g01hbc)

## 1 Purpose

nag_multi_normal (g01hbc) returns the upper tail, lower tail or central probability associated with a multivariate Normal distribution of up to ten dimensions.

## 2 Specification

```
#include <nag.h>
#include <nagg01.h>
double nag_multi_normal (Nag_TailProbability tail, Integer n,
       const double a[], const double b[], const double mean[],
       const double sigma[], Integer tdsig, double tol, Integer maxpts,
       NagError *fail)
```

## 3 Description

Let the vector random variable $X = (X_1, X_2, \ldots, X_n)^{\mathrm{T}}$ follow an $n$-dimensional multivariate Normal distribution with mean vector $\mu$ and $n$ by $n$ variance-covariance matrix $\Sigma$, then the probability density function, $f(X : \mu, \Sigma)$, is given by

$$f(X : \mu, \Sigma) = (2\pi)^{-(1/2)n}|\Sigma|^{-1/2}\exp\Big(-\tfrac{1}{2}(X-\mu)^{\mathrm{T}}\Sigma^{-1}(X-\mu)\Big).$$

The lower tail probability is defined by:

$$P(X_1 \leq b_1, \ldots, X_n \leq b_n : \mu, \Sigma) = \int_{-\infty}^{b_1} \cdots \int_{-\infty}^{b_n} f(X : \mu, \Sigma)\, dX_n \cdots dX_1.$$

The upper tail probability is defined by:

$$P(X_1 \geq a_1, \ldots, X_n \geq a_n : \mu, \Sigma) = \int_{a_1}^{\infty} \cdots \int_{a_n}^{\infty} f(X : \mu, \Sigma)\, dX_n \cdots dX_1.$$

The central probability is defined by:

$$P(a_1 \leq X_1 \leq b_1, \ldots, a_n \leq X_n \leq b_n : \mu, \Sigma) = \int_{a_1}^{b_1} \cdots \int_{a_n}^{b_n} f(X : \mu, \Sigma)\, dX_n \cdots dX_1.$$

To evaluate the probability for $n \geq 3$, the probability density function of $X_1, X_2, \ldots, X_n$ is considered as the product of the conditional probability of $X_1, X_2, \ldots, X_{n-2}$ given $X_{n-1}$ and $X_n$ and the marginal bivariate Normal distribution of $X_{n-1}$ and $X_n$. The bivariate Normal probability can be evaluated as described in nag_bivariate_normal_dist (g01hac) and numerical integration is then used over the remaining $n-2$ dimensions. In the case of $n = 3$, nag_1d_quad_gen_1 (d01sjc) is used and for $n > 3$ nag_multid_quad_adapt_1 (d01wcc) is used.

To evaluate the probability for $n = 1$ a direct call to nag_prob_normal (g01eac) is made and for $n = 2$ calls to nag_bivariate_normal_dist (g01hac) are made.

# 5 Arguments

1: **tail** – Nag_TailProbability *Input*

*On entry*: indicates which probability is to be returned.

**tail** = Nag_LowerTail
The lower tail probability is returned.

**tail** = Nag_UpperTail
The upper tail probability is returned.

**tail** = Nag_Central
The central probability is returned.

*Constraint*: **tail** = Nag_LowerTail, Nag_UpperTail or Nag_Central.

2: **n** – Integer *Input*

*On entry*: $n$, the number of dimensions.

*Constraint*: $1 \leq \mathbf{n} \leq 10$.

3: **a**[**n**] – const double *Input*

*On entry*: if **tail** = Nag_Central or Nag_UpperTail, the lower bounds, $a_i$, for $i = 1, 2, \ldots, n$.

If **tail** = Nag_LowerTail, **a** is not referenced.

4: **b**[**n**] – const double *Input*

*On entry*: if **tail** = Nag_Central or Nag_LowerTail, the upper bounds, $b_i$, for $i = 1, 2, \ldots, n$.

If **tail** = Nag_UpperTail, **b** is not referenced.

*Constraint*: if **tail** = Nag_Central, $\mathbf{a}[i-1] < \mathbf{b}[i-1]$, for $i = 1, 2, \ldots, n$.

5: **mean**[**n**] – const double *Input*

*On entry*: $\mu$, the mean vector of the multivariate Normal distribution.

6: **sigma**[**n** × **tdsig**] – const double *Input*

**Note**: the $(i, j)$th element of the matrix is stored in **sigma**$[(i-1) \times$ **tdsig** $+ j - 1]$.

*On entry*: $\Sigma$, the variance-covariance matrix of the multivariate Normal distribution. Only the lower triangle is referenced.

*Constraint*: $\Sigma$ must be positive definite.

7: **tdsig** – Integer *Input*

*On entry*: the stride separating matrix column elements in the array **sigma**.

*Constraint*: **tdsig** $\geq$ **n**.

8: **tol** – double *Input*

*On entry*: if $n > 2$ the relative accuracy required for the probability, and if the upper or the lower tail probability is requested then **tol** is also used to determine the cut-off points, see Section 7.

If $n = 1$, **tol** is not referenced.

*Suggested value*: **tol** = 0.0001.

*Constraint*: if **n** $> 1$, **tol** $> 0.0$.

9: **maxpts** – Integer *Input*

*On entry*: the maximum number of sub-intervals or integrand evaluations.

If $n = 3$, then the maximum number of sub-intervals used by nag_1d_quad_gen_1 (d01sjc) is **maxpts**/4. Note however increasing **maxpts** above 1000 will not increase the maximum number of sub-intervals above 250.

If $n > 3$ the maximum number of integrand evaluations used by nag_multid_quad_adapt_1 (d01wcc) is $\alpha$(**maxpts**/$n - 1$), where $\alpha = 2^{n-2} + 2(n-2)^2 + 2(n-2) + 1$.

If $n = 1$ or 2, then **maxpts** will not be used.

*Suggested value*: 2000 if $n > 3$ and 1000 if $n = 3$.

*Constraint*: if **n** $\geq 3$, **maxpts** $\geq 4 \times$ **n**.

10: **fail** – NagError * *Input/Output*

The NAG error argument (see Section 3.6 in the Essential Introduction).

## 6 Error Indicators and Warnings

**NE_2_INT_ARG_LT**

On entry, **tdsig** = ⟨*value*⟩ and **n** = ⟨*value*⟩.
Constraint: **tdsig** $\geq$ **n**.

**NE_2_REAL_ARRAYS_CONS**

On entry, the ⟨*value*⟩ value in **b** is less than or equal to the corresponding value in **a**.

**NE_ACC**

Full accuracy not achieved, relative accuracy = ⟨*value*⟩. A larger value of **tol** can be tried or the length of the workspace increased. The returned value is an approximation to the required result.

**NE_ALLOC_FAIL**

Dynamic memory allocation failed.
See Section 3.2.1.2 in the Essential Introduction for further information.

**NE_BAD_PARAM**

On entry, argument ⟨*value*⟩ had an illegal value.

**NE_INT_ARG_CONS**

On entry, **maxpts** = ⟨*value*⟩ and **n** = ⟨*value*⟩.
Constraint: if **n** $\geq 3$, **maxpts** $\geq 4 \times$ **n**.

On entry, **n** = ⟨*value*⟩.
Constraint: $1 \leq$ **n** $\leq 10$.

**NE_INTERNAL_ERROR**

An internal error has occurred in this function. Check the function call and any array sizes. If the call is correct then please contact NAG for assistance.

An unexpected error has been triggered by this function. Please contact NAG.
See Section 3.6.6 in the Essential Introduction for further information.

**NE_NO_LICENCE**

Your licence key may have expired or may not have been installed correctly.
See Section 3.6.5 in the Essential Introduction for further information.

**NE_POS_DEF**

On entry, **sigma** is not positive definite.

**NE_REAL_ARG_CONS**

On entry, **tol** $= \langle value \rangle$.
Constraint: **tol** $> 0.0$.

**NE_ROUND_OFF**

Accuracy requested by **tol** is too strict: **tol** $= \langle value \rangle$. Round-off error has prevented the requested accuracy from being achieved; a larger value of **tol** can be tried. The returned value will be an approximation to the required result.

## 7 Accuracy

The accuracy should be as specified by **tol**. When on exit **fail.code** = NE_ACC the approximate accuracy achieved is given in the error message. For the upper and lower tail probabilities the infinite limits are approximated by cut-off points for the $n-2$ dimensions over which the numerical integration takes place; these cut-off points are given by $\Phi^{-1}(\mathbf{tol}/(10 \times n))$, where $\Phi^{-1}$ is the inverse univariate Normal distribution function.

## 8 Parallelism and Performance

nag_multi_normal (g01hbc) is threaded by NAG for parallel execution in multithreaded implementations of the NAG Library.

nag_multi_normal (g01hbc) makes calls to BLAS and/or LAPACK routines, which may be threaded within the vendor library used by this implementation. Consult the documentation for the vendor library for further information.

Please consult the X06 Chapter Introduction for information on how to control and interrogate the OpenMP environment used within this function. Please also consult the Users' Note for your implementation for any additional implementation-specific information.

## 9 Further Comments

The time taken is related to the number of dimensions, the range over which the integration takes place ($b_i - a_i$, for $i = 1, 2, \ldots, n$) and the value of $\Sigma$ as well as the accuracy required. As the numerical integration does not take place over the last two dimensions speed may be improved by arranging $X$ so that the largest ranges of integration are for $X_{n-1}$ and $X_n$.

## 10 Example

This example reads in the mean and covariance matrix for a multivariate Normal distribution and computes and prints the associated central probability.
