NAG Library Routine Document

F08QVF (ZTRSYL)

Note: before using this routine, please read the Users' Note for your implementation to check the interpretation of *bold italicised* terms and other implementation-dependent details.

1 Purpose

F08QVF (ZTRSYL) solves the complex triangular Sylvester matrix equation.

2 Specification

```
SUBROUTINE F08QVF (TRANA, TRANB, ISGN, M, N, A, LDA, B, LDB, C, LDC, SCAL, INFO)
```

INTEGER ISGN, M, N, LDA, LDB, LDC, INFO REAL (KIND=nag_wp) SCAL COMPLEX (KIND=nag_wp) A(LDA,*), B(LDB,*), C(LDC,*) CHARACTER(1) TRANA, TRANB

The routine may be called by its LAPACK name ztrsyl.

3 Description

F08QVF (ZTRSYL) solves the complex Sylvester matrix equation

$$\operatorname{op}(A)X \pm X \operatorname{op}(B) = \alpha C,$$

where op(A) = A or A^{H} , and the matrices A and B are upper triangular; α is a scale factor (≤ 1) determined by the routine to avoid overflow in X; A is m by m and B is n by n while the right-hand side matrix C and the solution matrix X are both m by n. The matrix X is obtained by a straightforward process of back-substitution (see Golub and Van Loan (1996)).

Note that the equation has a unique solution if and only if $\alpha_i \pm \beta_j \neq 0$, where $\{\alpha_i\}$ and $\{\beta_j\}$ are the eigenvalues of A and B respectively and the sign (+ or -) is the same as that used in the equation to be solved.

5 Parameters

1: TRANA - CHARACTER(1)

On entry: specifies the option op(A).

TRANA = 'N' op(A) = A.TRANA = 'C' $op(A) = A^{H}.$ *Constraint*: TRANA = 'N' or 'C'. Input

2:	TRANB – CHARACTER(1)	Input
	On entry: specifies the option $op(B)$.	
	TRANB = 'N' $op(B) = B.$	
	TRANB = 'C' op(B) = B ^H .	
	Constraint: $TRANB = 'N'$ or 'C'.	
3:	ISGN – INTEGER	Input
	On entry: indicates the form of the Sylvester equation.	
	ISGN = +1 The equation is of the form $op(A)X + X op(B) = \alpha C$.	
	ISGN = -1	
	The equation is of the form $op(A)X - X op(B) = \alpha C$.	
	Constraint: $ISGN = +1$ or -1 .	
4:	M – INTEGER	Input
	On entry: m, the order of the matrix A, and the number of rows in the matrices X and	C.
	Constraint: $M \ge 0$.	
5:	N – INTEGER	Input
	On entry: n , the order of the matrix B , and the number of columns in the matrices X a	nd C.
	Constraint: $N \ge 0$.	
6:	A(LDA,*) - COMPLEX (KIND=nag_wp) array	Input
	Note: the second dimension of the array A must be at least $max(1, M)$.	
	On entry: the m by m upper triangular matrix A .	
7:	LDA – INTEGER	Input
	<i>On entry</i> : the first dimension of the array A as declared in the (sub)program from which I (ZTRSYL) is called.	F08QVF
	Constraint: LDA $\geq \max(1, M)$.	
8:	B(LDB,*) – COMPLEX (KIND=nag_wp) array	Inspirt
о.	Note: the second dimension of the array B must be at least $max(1,N)$.	Input
	On entry: the n by n upper triangular matrix B .	
9:	LDB – INTEGER	Input
	<i>On entry</i> : the first dimension of the array B as declared in the (sub)program from which I (ZTRSYL) is called.	F08QVF
	Constraint: $LDB \ge max(1, N)$.	
10:	C(LDC,*) – COMPLEX (KIND=nag_wp) array Input	t/Output
	Note: the second dimension of the array C must be at least $max(1, N)$.	
	On entry: the m by n right-hand side matrix C .	
	On exit: C is overwritten by the solution matrix X.	

11: LDC – INTEGER

On entry: the first dimension of the array C as declared in the (sub)program from which F08QVF (ZTRSYL) is called.

Constraint: LDC $\geq \max(1, M)$.

12: SCAL – REAL (KIND=nag wp)

On exit: the value of the scale factor α .

13: INFO – INTEGER

On exit: INFO = 0 unless the routine detects an error (see Section 6).

6 Error Indicators and Warnings

INFO < 0

If INFO = -i, argument *i* had an illegal value. An explanatory message is output, and execution of the program is terminated.

INFO = 1

A and B have common or close eigenvalues, perturbed values of which were used to solve the equation.

7 Accuracy

Consider the equation AX - XB = C. (To apply the remarks to the equation AX + XB = C, simply replace B by -B.)

Let \tilde{X} be the computed solution and R the residual matrix:

$$R = C - (A\tilde{X} - \tilde{X}B).$$

Then the residual is always small:

$$||R||_F = O(\epsilon) (||A||_F + ||B||_F) ||\tilde{X}||_F.$$

However, \tilde{X} is **not** necessarily the exact solution of a slightly perturbed equation; in other words, the solution is not backwards stable.

For the forward error, the following bound holds:

$$\left\|\tilde{X} - X\right\|_F \le \frac{\|R\|_F}{sep(A,B)}$$

but this may be a considerable over estimate. See Golub and Van Loan (1996) for a definition of sep(A, B), and Higham (1992) for further details.

These remarks also apply to the solution of a general Sylvester equation, as described in Section 9.

8 Parallelism and Performance

F08QVF (ZTRSYL) is not threaded by NAG in any implementation.

F08QVF (ZTRSYL) makes calls to BLAS and/or LAPACK routines, which may be threaded within the vendor library used by this implementation. Consult the documentation for the vendor library for further information.

Please consult the X06 Chapter Introduction for information on how to control and interrogate the OpenMP environment used within this routine. Please also consult the Users' Note for your implementation for any additional implementation-specific information.

Input

Output

Output

9 Further Comments

The total number of real floating-point operations is approximately 4mn(m+n).

To solve the general complex Sylvester equation

$$AX \pm XB = C$$

where A and B are general matrices, A and B must first be reduced to Schur form (by calling F08PNF (ZGEES), for example):

$$A = Q_1 \tilde{A} Q_1^{\mathrm{H}}$$
 and $B = Q_2 \tilde{B} Q_2^{\mathrm{H}}$

where \tilde{A} and \tilde{B} are upper triangular and Q_1 and Q_2 are unitary. The original equation may then be transformed to:

$$\tilde{A}\tilde{X} \pm \tilde{X}\tilde{B} = \tilde{C}$$

where $\tilde{X} = Q_1^H X Q_2$ and $\tilde{C} = Q_1^H C Q_2$. \tilde{C} may be computed by matrix multiplication; F08QVF (ZTRSYL) may be used to solve the transformed equation; and the solution to the original equation can be obtained as $X = Q_1 \tilde{X} Q_2^H$.

The real analogue of this routine is F08QHF (DTRSYL).

10 Example

This example solves the Sylvester equation AX + XB = C, where

$$A = \begin{pmatrix} -6.00 - 7.00i & 0.36 - 0.36i & -0.19 + 0.48i & 0.88 - 0.25i \\ 0.00 + 0.00i & -5.00 + 2.00i & -0.03 - 0.72i & -0.23 + 0.13i \\ 0.00 + 0.00i & 0.00 + 0.00i & 8.00 - 1.00i & 0.94 + 0.53i \\ 0.00 + 0.00i & 0.00 + 0.00i & 0.00 + 0.00i & 3.00 - 4.00i \end{pmatrix},$$

$$B = \begin{pmatrix} 0.50 - 0.20i & -0.29 - 0.16i & -0.37 + 0.84i & -0.55 + 0.73i \\ 0.00 + 0.00i & -0.40 + 0.90i & 0.06 + 0.22i & -0.43 + 0.17i \\ 0.00 + 0.00i & 0.00 + 0.00i & -0.90 - 0.10i & -0.89 - 0.42i \\ 0.00 + 0.00i & 0.00 + 0.00i & 0.00 + 0.00i & 0.30 - 0.70i \end{pmatrix}$$

and

$$C = \begin{pmatrix} 0.63 + 0.35i & 0.45 - 0.56i & 0.08 - 0.14i & -0.17 - 0.23i \\ -0.17 + 0.09i & -0.07 - 0.31i & 0.27 - 0.54i & 0.35 + 1.21i \\ -0.93 - 0.44i & -0.33 - 0.35i & 0.41 - 0.03i & 0.57 + 0.84i \\ 0.54 + 0.25i & -0.62 - 0.05i & -0.52 - 0.13i & 0.11 - 0.08i \end{pmatrix}.$$
