# NAG Library Routine Document F08RNF (ZUNCSD)

Note: before using this routine, please read the Users' Note for your implementation to check the interpretation of **bold italicised** terms and other implementation-dependent details.

# 1 Purpose

F08RNF (ZUNCSD) computes the CS decomposition of a complex m by m unitary matrix X, partitioned into a 2 by 2 array of submatrices.

# 2 Specification

```
SUBROUTINE FO8RNF (JOBU1, JOBU2, JOBV1T, JOBV2T, TRANS, SIGNS, M, P, Q, X11, LDX11, X12, LDX12, X21, LDX21, X22, LDX22, ETHETA, U1, LDU1, U2, LDU2, V1T, LDV1T, V2T, LDV2T, WORK, LWORK, RWORK, LRWORK, IWORK, INFO)

INTEGER

M, P, Q, LDX11, LDX12, LDX21, LDX22, LDU1, LDU2, LDV1T, LDV2T, LWORK, LRWORK, IWORK, IWORK (M-min(P,M-P,Q,M-Q)), INFO

REAL (KIND=nag_wp) THETA(min(P,M-P,Q,M-Q)), RWORK(max(1,LRWORK))

COMPLEX (KIND=nag_wp) X11(LDX11,*), X12(LDX12,*), X21(LDX21,*), X22(LDX22,*), U1(LDU1,*), U2(LDU2,*), V1T(LDV1T,*), V2T(LDV2T,*), WORK(max(1,LWORK))

CHARACTER(1) JOBU1, JOBU2, JOBV1T, JOBV2T, TRANS, SIGNS
```

The routine may be called by its LAPACK name zuncsd.

# 3 Description

The m by m unitary matrix X is partitioned as

$$X = \begin{pmatrix} X_{11} & X_{12} \\ X_{21} & X_{22} \end{pmatrix}$$

where  $X_{11}$  is a p by q submatrix and the dimensions of the other submatrices  $X_{12}$ ,  $X_{21}$  and  $X_{22}$  are such that X remains m by m.

The CS decomposition of X is  $X = U\Sigma_p V^T$  where U, V and  $\Sigma_p$  are m by m matrices, such that

$$U = \begin{pmatrix} U_1 & \mathbf{0} \\ \mathbf{0} & U_2 \end{pmatrix}$$

is a unitary matrix containing the p by p unitary matrix  $U_1$  and the (m-p) by (m-p) unitary matrix  $U_2$ ;

$$V = \left( \begin{array}{cc} V_1 & \mathbf{0} \\ \mathbf{0} & V_2 \end{array} \right)$$

is a unitary matrix containing the q by q unitary matrix  $V_1$  and the (m-q) by (m-q) unitary matrix  $V_2$ ; and

$$\Sigma_p = \begin{pmatrix}
I_{11} & \mathbf{0} & \mathbf{0} & \mathbf{0} & \mathbf{0} \\
& C & \mathbf{0} & \mathbf{0} & -S & \\
\mathbf{0} & \mathbf{0} & \mathbf{0} & -I_{12} \\
& \mathbf{0} & \mathbf{0} & I_{22} & \mathbf{0} \\
\mathbf{0} & S & C & \mathbf{0} \\
\mathbf{0} & I_{21} & \mathbf{0} & \mathbf{0}
\end{pmatrix}$$

F08RNF NAG Library Manual

contains the r by r non-negative diagonal submatrices C and S satisfying  $C^2 + S^2 = I$ , where  $r = \min(p, m - p, q, m - q)$  and the top left partition is p by q.

The identity matrix  $I_{11}$  is of order  $\min(p,q) - r$  and vanishes if  $\min(p,q) = r$ .

The identity matrix  $I_{12}$  is of order  $\min(p, m-q) - r$  and vanishes if  $\min(p, m-q) = r$ .

The identity matrix  $I_{21}$  is of order  $\min(m-p,q)-r$  and vanishes if  $\min(m-p,q)=r$ .

The identity matrix  $I_{22}$  is of order  $\min(m-p, m-q) - r$  and vanishes if  $\min(m-p, m-q) = r$ .

In each of the four cases r = p, q, m - p, m - q at least two of the identity matrices vanish.

The indicated zeros represent augmentations by additional rows or columns (but not both) to the square diagonal matrices formed by  $I_{ij}$  and C or S.

 $\Sigma_p$  does not need to be stored in full; it is sufficient to return only the values  $\theta_i$  for  $i=1,2,\ldots,r$  where  $C_{ii}=\cos(\theta_i)$  and  $S_{ii}=\sin(\theta_i)$ .

The algorithm used to perform the complete CS decomposition is described fully in Sutton (2009) including discussions of the stability and accuracy of the algorithm.

# 5 Parameters

1: JOBU1 – CHARACTER(1)

Input

On entry:

if JOBU1 = 'Y',  $U_1$  is computed; otherwise,  $U_1$  is not computed.

2: JOBU2 - CHARACTER(1)

Input

On entry:

if JOBU2 = 'Y',  $U_2$  is computed; otherwise,  $U_2$  is not computed.

3: JOBV1T - CHARACTER(1)

Input

On entry:

if JOBV1T = 'Y',  $V_1^T$  is computed; otherwise,  $V_1^T$  is not computed.

4: JOBV2T - CHARACTER(1)

Input

On entry:

if JOBV2T = 'Y',  $V_2^{\text{T}}$  is computed; otherwise,  $V_2^{\text{T}}$  is not computed.

F08RNF.2 Mark 25

## 5: TRANS – CHARACTER(1)

Input

On entry:

if TRANS = 'T', X,  $U_1$ ,  $U_2$ ,  $V_1^{\rm T}$  and  $V_2^{\rm T}$  are stored in row-major order; otherwise, X,  $U_1$ ,  $U_2$ ,  $V_1^{\rm T}$  and  $V_2^{\rm T}$  are stored in column-major order.

## 6: SIGNS – CHARACTER(1)

Input

On entry:

if SIGNS = 'O', the lower-left block is made nonpositive (the other convention); otherwise, the upper-right block is made nonpositive (the default convention).

#### 7: M - INTEGER

Input

On entry: m, the number of rows and columns in the unitary matrix X.

Constraint:  $M \ge 0$ .

## 8: P - INTEGER

Input

On entry: p, the number of rows in  $X_{11}$  and  $X_{12}$ .

*Constraint*:  $0 \le P \le M$ .

## 9: Q – INTEGER

Input

On entry: q, the number of columns in  $X_{11}$  and  $X_{21}$ .

Constraint:  $0 \le Q \le M$ .

# 10: X11(LDX11,\*) - COMPLEX (KIND=nag\_wp) array

Input/Output

**Note**: the second dimension of the array X11 must be at least max(1, P) if TRANS = T', and at least Q otherwise.

On entry: the upper left partition of the unitary matrix X whose CSD is desired.

On exit: contains details of the unitary matrix used in a simultaneous bidiagonalization process.

# 11: LDX11 – INTEGER

Input

On entry: the first dimension of the array X11 as declared in the (sub)program from which F08RNF (ZUNCSD) is called.

Constraints:

```
if TRANS = 'T', LDX11 \geq max(1, Q); otherwise LDX11 \geq max(1, P).
```

## 12: X12(LDX12,\*) - COMPLEX (KIND=nag wp) array

Input/Output

**Note**: the second dimension of the array X12 must be at least max(1, P) if TRANS = T', and at least M - Q otherwise.

On entry: the upper right partition of the unitary matrix X whose CSD is desired.

On exit: contains details of the unitary matrix used in a simultaneous bidiagonalization process.

# 13: LDX12 – INTEGER

Input

On entry: the first dimension of the array X12 as declared in the (sub)program from which F08RNF (ZUNCSD) is called.

Constraints:

```
if TRANS = 'T', LDX12 \geq max(1, M - Q); otherwise LDX12 \geq max(1, P).
```

# 14: X21(LDX21,\*) - COMPLEX (KIND=nag\_wp) array

Input/Output

**Note**: the second dimension of the array X21 must be at least max(1, M - P) if TRANS = 'T', and at least Q otherwise.

On entry: the lower left partition of the unitary matrix X whose CSD is desired.

On exit: contains details of the unitary matrix used in a simultaneous bidiagonalization process.

#### 15: LDX21 – INTEGER

Input

On entry: the first dimension of the array X21 as declared in the (sub)program from which F08RNF (ZUNCSD) is called.

Constraints:

```
if TRANS = 'T', LDX21 \geq max(1, Q); otherwise LDX21 \geq max(1, M - P).
```

## 16: X22(LDX22,\*) - COMPLEX (KIND=nag\_wp) array

Input/Output

**Note**: the second dimension of the array X22 must be at least max(1, M - P) if TRANS = 'T', and at least M - O otherwise.

On entry: the lower right partition of the unitary matrix X CSD is desired.

On exit: contains details of the unitary matrix used in a simultaneous bidiagonalization process.

## 17: LDX22 - INTEGER

Input

On entry: the first dimension of the array X22 as declared in the (sub)program from which F08RNF (ZUNCSD) is called.

Constraints:

```
if TRANS = 'T', LDX22 \geq max(1, M - Q); otherwise LDX22 \geq max(1, M - P).
```

## 18: THETA $(\min(P, M - P, Q, M - Q))$ - REAL (KIND=nag wp) array

Output

On exit: the values  $\theta_i$  for  $i=1,2,\ldots,r$  where  $r=\min(p,m-p,q,m-q)$ . The diagonal submatrices C and S of  $\Sigma_p$  are constructed from these values as

```
C = \operatorname{diag}(\cos(\operatorname{THETA}(1)), \dots, \cos(\operatorname{THETA}(r))) and S = \operatorname{diag}(\sin(\operatorname{THETA}(1)), \dots, \sin(\operatorname{THETA}(r))).
```

# 19: U1(LDU1,\*) - COMPLEX (KIND=nag\_wp) array

Output

**Note**: the second dimension of the array U1 must be at least max(1, P) if JOBU1 = 'Y', and at least 1 otherwise.

On exit: if JOBU1 = 'Y', U1 contains the p by p unitary matrix  $U_1$ .

#### 20: LDU1 – INTEGER

Input

On entry: the first dimension of the array U1 as declared in the (sub)program from which F08RNF (ZUNCSD) is called.

Constraint: if JOBU1 = 'Y',  $LDU1 \ge max(1, P)$ .

F08RNF.4 Mark 25

# 21: U2(LDU2,\*) - COMPLEX (KIND=nag wp) array

Output

**Note**: the second dimension of the array U2 must be at least max(1, M - P) if JOBU2 = 'Y', and at least 1 otherwise.

On exit: if JOBU2 = 'Y', U2 contains the m-p by m-p unitary matrix  $U_2$ .

## 22: LDU2 – INTEGER

Input

On entry: the first dimension of the array U2 as declared in the (sub)program from which F08RNF (ZUNCSD) is called.

Constraint: if JOBU2 = 'Y',  $LDU2 \ge max(1, M - P)$ .

## 23: V1T(LDV1T,\*) - COMPLEX (KIND=nag wp) array

Output

**Note**: the second dimension of the array V1T must be at least max(1, Q) if JOBV1T = 'Y', and at least 1 otherwise.

On exit: if JOBV1T = 'Y', V1T contains the q by q unitary matrix  $V_1^H$ .

### 24: LDV1T - INTEGER

Input

On entry: the first dimension of the array V1T as declared in the (sub)program from which F08RNF (ZUNCSD) is called.

Constraint: if JOBV1T = 'Y',  $LDV1T \ge max(1, Q)$ .

## 25: V2T(LDV2T,\*) - COMPLEX (KIND=nag\_wp) array

Output

**Note**: the second dimension of the array V2T must be at least max(1, M - Q) if JOBV2T = 'Y', and at least 1 otherwise.

On exit: if JOBV2T = 'Y', V2T contains the m-q by m-q unitary matrix  $V_2^H$ .

## 26: LDV2T - INTEGER

Input

On entry: the first dimension of the array V2T as declared in the (sub)program from which F08RNF (ZUNCSD) is called.

Constraint: if JOBV2T = 'Y',  $LDV2T \ge max(1, M - Q)$ .

# 27: WORK(max(1,LWORK)) - COMPLEX (KIND=nag\_wp) array

Workspace

On exit: if INFO = 0, WORK(1) returns the optimal LWORK.

If INFO > 0 on exit, WORK(2:r) contains the values PHI $(1), \dots$ PHI(r-1) that, together with THETA $(1), \dots$ THETA(r), define the matrix in intermediate bidiagonal-block form remaining after nonconvergence. INFO specifies the number of nonzero PHI's.

# 28: LWORK - INTEGER

Input

On entry:

If LWORK = -1, a workspace query is assumed; the routine only calculates the optimal size of the WORK array, returns this value as the first entry of the WORK array, and no error message related to LWORK is issued.

The minimum workspace required is  $\max(1,P) + \max(1,M-P) + \max(1,Q) + \max(1,M-Q) + \max(1,P,M-P,Q,M-Q) + 1$ ; the optimal amount of workspace depends on internal block sizes and the relative problem dimensions.

## Constraint:

$$LWORK = -1 \text{ or } LWORK \ge max(1, P) + max(1, M - P) + max(1, Q) + max(1, M - Q) + max(1, P, M - P, Q, M - Q) + 1.$$

F08RNF NAG Library Manual

29: RWORK(max(1,LRWORK)) - REAL (KIND=nag wp) array

Workspace

30: LRWORK - INTEGER

Input

On entry:

If LRWORK = -1, a workspace query is assumed; the routine only calculates the optimal size of the WORK array, returns this value as the first entry of the WORK array, and no error message related to LRWORK is issued. Otherwise the required workspace is  $5 \times \max(1, Q-1) + 4 \times \max(1, Q) + \max(1, 8 \times Q) + 1$  which equates to 11 for Q=0, 18 for Q=1 and  $17 \times Q-4$  when Q>1.

Constraint

 $LRWORK = -1 \text{ or } LRWORK \ge 5 \times max(1, Q - 1) + 4 \times max(1, Q) + max(1, 8 \times Q) + 1.$ 

31: IWORK(M - min(P, M - P, Q, M - Q)) - INTEGER array

Workspace

32: INFO – INTEGER

Output

On exit: INFO = 0 unless the routine detects an error (see Section 6).

# 6 Error Indicators and Warnings

INFO < 0

If INFO = -i, argument i had an illegal value. An explanatory message is output, and execution of the program is terminated.

INFO > 0

The Jacobi-type procedure failed to converge during an internal reduction to bidiagonal-block form. The process requires convergence to min(P, M-P, Q, M-Q) values, the value of INFO gives the number of converged values.

# 7 Accuracy

The computed CS decomposition is nearly the exact CS decomposition for the nearby matrix (X + E), where

$$||E||_2 = O(\epsilon),$$

and  $\epsilon$  is the *machine precision*.

# 8 Parallelism and Performance

F08RNF (ZUNCSD) is threaded by NAG for parallel execution in multithreaded implementations of the NAG Library.

F08RNF (ZUNCSD) makes calls to BLAS and/or LAPACK routines, which may be threaded within the vendor library used by this implementation. Consult the documentation for the vendor library for further information.

Please consult the X06 Chapter Introduction for information on how to control and interrogate the OpenMP environment used within this routine. Please also consult the Users' Note for your implementation for any additional implementation-specific information.

# 9 Further Comments

The total number of floating-point operations required to perform the full CS decomposition is approximately  $2m^3$ .

The real analogue of this routine is F08RAF (DORCSD).

F08RNF.6 Mark 25

# 10 Example

This example finds the full CS decomposition of a unitary 6 by 6 matrix X (see Section 10.2) partitioned in 3 by 3 blocks.

The decomposition is performed both on submatrices of the unitary matrix X and on separated partition matrices. Code is also provided to perform a recombining check if required.
