

NAG Library Routine Document

F08SQF (ZHEGVD)

Note: before using this routine, please read the Users' Note for your implementation to check the interpretation of *bold italicised* terms and other implementation-dependent details.

1 Purpose

F08SQF (ZHEGVD) computes all the eigenvalues and, optionally, the eigenvectors of a complex generalized Hermitian-definite eigenproblem, of the form

$$Az = \lambda Bz, \quad ABz = \lambda z \quad \text{or} \quad BAz = \lambda z,$$

where A and B are Hermitian and B is also positive definite. If eigenvectors are desired, it uses a divide-and-conquer algorithm.

2 Specification

```

SUBROUTINE F08SQF ( ITYPE, JOBZ, UPLO, N, A, LDA, B, LDB, W, WORK, LWORK,      &
                   RWORK, LRWORK, IWORK, LIWORK, INFO)
INTEGER              ITYPE, N, LDA, LDB, LWORK, LRWORK,                &
                   IWORK(max(1,LIWORK)), LIWORK, INFO
REAL (KIND=nag_wp)  W(N), RWORK(max(1,LRWORK))
COMPLEX (KIND=nag_wp) A(LDA,*), B(LDB,*), WORK(max(1,LWORK))
CHARACTER(1)        JOBZ, UPLO

```

The routine may be called by its LAPACK name *zhegvd*.

3 Description

F08SQF (ZHEGVD) first performs a Cholesky factorization of the matrix B as $B = U^H U$, when $UPLO = 'U'$ or $B = LL^H$, when $UPLO = 'L'$. The generalized problem is then reduced to a standard symmetric eigenvalue problem

$$Cx = \lambda x,$$

which is solved for the eigenvalues and, optionally, the eigenvectors; the eigenvectors are then backtransformed to give the eigenvectors of the original problem.

For the problem $Az = \lambda Bz$, the eigenvectors are normalized so that the matrix of eigenvectors, z , satisfies

$$Z^H A Z = \Lambda \quad \text{and} \quad Z^H B Z = I,$$

where Λ is the diagonal matrix whose diagonal elements are the eigenvalues. For the problem $ABz = \lambda z$ we correspondingly have

$$Z^{-1} A Z^{-H} = \Lambda \quad \text{and} \quad Z^H B Z = I,$$

and for $BAz = \lambda z$ we have

$$Z^H A Z = \Lambda \quad \text{and} \quad Z^H B^{-1} Z = I.$$

5 Arguments

- 1: ITYPE – INTEGER *Input*
On entry: specifies the problem type to be solved.
 ITYPE = 1
 $Az = \lambda Bz.$
 ITYPE = 2
 $ABz = \lambda z.$
 ITYPE = 3
 $BAz = \lambda z.$
Constraint: ITYPE = 1, 2 or 3.
- 2: JOBZ – CHARACTER(1) *Input*
On entry: indicates whether eigenvectors are computed.
 JOBZ = 'N'
 Only eigenvalues are computed.
 JOBZ = 'V'
 Eigenvalues and eigenvectors are computed.
Constraint: JOBZ = 'N' or 'V'.
- 3: UPLO – CHARACTER(1) *Input*
On entry: if UPLO = 'U', the upper triangles of A and B are stored.
 If UPLO = 'L', the lower triangles of A and B are stored.
Constraint: UPLO = 'U' or 'L'.
- 4: N – INTEGER *Input*
On entry: n , the order of the matrices A and B .
Constraint: $N \geq 0$.
- 5: A(LDA,*) – COMPLEX (KIND=nag_wp) array *Input/Output*
Note: the second dimension of the array A must be at least $\max(1, N)$.
On entry: the n by n Hermitian matrix A .
 If UPLO = 'U', the upper triangular part of A must be stored and the elements of the array below the diagonal are not referenced.
 If UPLO = 'L', the lower triangular part of A must be stored and the elements of the array above the diagonal are not referenced.
On exit: if JOBZ = 'V', A contains the matrix Z of eigenvectors. The eigenvectors are normalized as follows:
 if ITYPE = 1 or 2, $Z^H B Z = I$;
 if ITYPE = 3, $Z^H B^{-1} Z = I$.
 If JOBZ = 'N', the upper triangle (if UPLO = 'U') or the lower triangle (if UPLO = 'L') of A , including the diagonal, is overwritten.

- 6: LDA – INTEGER *Input*
On entry: the first dimension of the array A as declared in the (sub)program from which F08SQF (ZHEGVD) is called.
Constraint: $LDA \geq \max(1, N)$.
- 7: B(LDB, *) – COMPLEX (KIND=nag_wp) array *Input/Output*
Note: the second dimension of the array B must be at least $\max(1, N)$.
On entry: the n by n Hermitian matrix B .
 If UPLO = 'U', the upper triangular part of B must be stored and the elements of the array below the diagonal are not referenced.
 If UPLO = 'L', the lower triangular part of B must be stored and the elements of the array above the diagonal are not referenced.
On exit: the triangular factor U or L from the Cholesky factorization $B = U^H U$ or $B = LL^H$.
- 8: LDB – INTEGER *Input*
On entry: the first dimension of the array B as declared in the (sub)program from which F08SQF (ZHEGVD) is called.
Constraint: $LDB \geq \max(1, N)$.
- 9: W(N) – REAL (KIND=nag_wp) array *Output*
On exit: the eigenvalues in ascending order.
- 10: WORK(max(1, LWORK)) – COMPLEX (KIND=nag_wp) array *Workspace*
On exit: if INFO = 0, the real part of WORK(1) contains the minimum value of LWORK required for optimal performance.
- 11: LWORK – INTEGER *Input*
On entry: the dimension of the array WORK as declared in the (sub)program from which F08SQF (ZHEGVD) is called.
 If LWORK = -1, a workspace query is assumed; the routine only calculates the optimal sizes of the WORK, RWORK and IWORK arrays, returns these values as the first entries of the WORK, RWORK and IWORK arrays, and no error message related to LWORK, LRWORK or LIWORK is issued.
Suggested value: for optimal performance, LWORK should usually be larger than the minimum, try increasing by $nb \times N$, where nb is the optimal **block size**.
Constraints:
 if $N \leq 1$, $LWORK \geq 1$;
 if JOBZ = 'N' and $N > 1$, $LWORK \geq N + 1$;
 if JOBZ = 'V' and $N > 1$, $LWORK \geq 2 \times N + N^2$.
- 12: RWORK(max(1, LRWORK)) – REAL (KIND=nag_wp) array *Workspace*
On exit: if INFO = 0, RWORK(1) returns the optimal LRWORK.
- 13: LRWORK – INTEGER *Input*
On entry: the dimension of the array RWORK as declared in the (sub)program from which F08SQF (ZHEGVD) is called.
 If LRWORK = -1, a workspace query is assumed; the routine only calculates the optimal sizes of the WORK, RWORK and IWORK arrays, returns these values as the first entries of the

WORK, RWORK and IWORK arrays, and no error message related to LWORK, LRWORK or LIWORK is issued.

Constraints:

- if $N \leq 1$, $LRWORK \geq 1$;
- if $JOBZ = 'N'$ and $N > 1$, $LRWORK \geq N$;
- if $JOBZ = 'V'$ and $N > 1$, $LRWORK \geq 1 + 5 \times N + 2 \times N^2$.

14: IWORK(max(1, LIWORK)) – INTEGER array *Workspace*

On exit: if INFO = 0, IWORK(1) returns the optimal LIWORK.

15: LIWORK – INTEGER *Input*

On entry: the dimension of the array IWORK as declared in the (sub)program from which F08SQF (ZHEGVD) is called.

If LIWORK = -1, a workspace query is assumed; the routine only calculates the optimal sizes of the WORK, RWORK and IWORK arrays, returns these values as the first entries of the WORK, RWORK and IWORK arrays, and no error message related to LWORK, LRWORK or LIWORK is issued.

Constraints:

- if $N \leq 1$, $LIWORK \geq 1$;
- if $JOBZ = 'N'$ and $N > 1$, $LIWORK \geq 1$;
- if $JOBZ = 'V'$ and $N > 1$, $LIWORK \geq 3 + 5 \times N$.

16: INFO – INTEGER *Output*

On exit: INFO = 0 unless the routine detects an error (see Section 6).

6 Error Indicators and Warnings

INFO < 0

If INFO = - i , argument i had an illegal value. An explanatory message is output, and execution of the program is terminated.

INFO = 1 to N

If INFO = i , F08FQF (ZHEEVD) failed to converge; i i off-diagonal elements of an intermediate tridiagonal form did not converge to zero.

INFO > N

F07FRF (ZPOTRF) returned an error code; i.e., if INFO = $N + i$, for $1 \leq i \leq N$, then the leading minor of order i of B is not positive definite. The factorization of B could not be completed and no eigenvalues or eigenvectors were computed.

7 Accuracy

If B is ill-conditioned with respect to inversion, then the error bounds for the computed eigenvalues and vectors may be large, although when the diagonal elements of B differ widely in magnitude the eigenvalues and eigenvectors may be less sensitive than the condition of B would suggest. See Section 4.10 of Anderson *et al.* (1999) for details of the error bounds.

The example program below illustrates the computation of approximate error bounds.

8 Parallelism and Performance

F08SQF (ZHEGVD) is threaded by NAG for parallel execution in multithreaded implementations of the NAG Library.

F08SQF (ZHEGVD) makes calls to BLAS and/or LAPACK routines, which may be threaded within the vendor library used by this implementation. Consult the documentation for the vendor library for further information.

Please consult the X06 Chapter Introduction for information on how to control and interrogate the OpenMP environment used within this routine. Please also consult the Users' Note for your implementation for any additional implementation-specific information.

9 Further Comments

The total number of floating-point operations is proportional to n^3 .

The real analogue of this routine is F08SCF (DSYGVD).

10 Example

This example finds all the eigenvalues and eigenvectors of the generalized Hermitian eigenproblem $ABz = \lambda z$, where

$$A = \begin{pmatrix} -7.36 & 0.77 - 0.43i & -0.64 - 0.92i & 3.01 - 6.97i \\ 0.77 + 0.43i & 3.49 & 2.19 + 4.45i & 1.90 + 3.73i \\ -0.64 + 0.92i & 2.19 - 4.45i & 0.12 & 2.88 - 3.17i \\ 3.01 + 6.97i & 1.90 - 3.73i & 2.88 + 3.17i & -2.54 \end{pmatrix}$$

and

$$B = \begin{pmatrix} 3.23 & 1.51 - 1.92i & 1.90 + 0.84i & 0.42 + 2.50i \\ 1.51 + 1.92i & 3.58 & -0.23 + 1.11i & -1.18 + 1.37i \\ 1.90 - 0.84i & -0.23 - 1.11i & 4.09 & 2.33 - 0.14i \\ 0.42 - 2.50i & -1.18 - 1.37i & 2.33 + 0.14i & 4.29 \end{pmatrix},$$

together with an estimate of the condition number of B , and approximate error bounds for the computed eigenvalues and eigenvectors.

The example program for F08SNF (ZHEGV) illustrates solving a generalized Hermitian eigenproblem of the form $Az = \lambda Bz$.
